Global Standards and Web Architectures for eGovernment Projects

> José M.Alonso - eGoverment Lead (<u>W3C/CTIC</u>) <josema@w3.org>

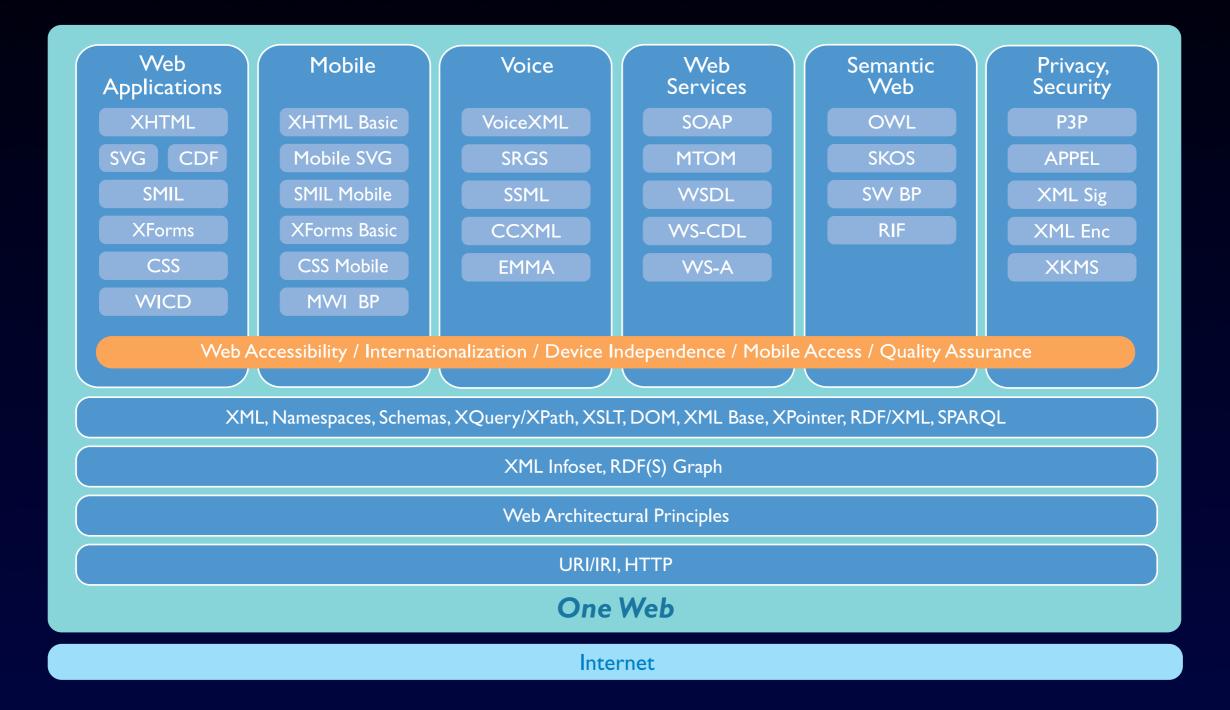

World Wide Web Consortium (W3C)

Leading the Web to its Full Potential

W3C

- Founded by Web inventor Tim Berners-Lee (1994)
- W3C Provides the Vision and the Standards to Lead the Web:
 - From a Web of Documents... toward One Web:
 - of Data and Services
 - on Everything
 - for Everyone

Where's Wally eGov?

Keeping it simple

• eGovernment

"the use of ICTs, and particularly the Internet, as a tool to achieve better government"

The Web is the main channel to deliver eGovernment services

A Big Picture

Why W3C has been caring?

- The Web has become the main channel for Govs to deliver eServices to citizens
- Web tech. plays a crucial role in the relationships between Govs, and between Govs and Industry
- Use of W3C Tech. in eGov is constantly increasing
 - they've even started to appear in laws all over the world (e.g. Web Accessibility)
- Govs give increasing importance to consensus building and open standards

W3C and eGov, an old story

... and not only a technical one

Platform for Internet Content Selection (PICS)

Started in 1996

"originally designed to help parents and teachers control what children access on the Internet, but it also facilitates other uses for labels, including code signing and privacy"

W3C and eGov, an old story

Platform for Privacy Preferences (P3P)

Started in 1998

"enables Websites to express their privacy practices in a standard format that can be retrieved automatically and interpreted easily by user agents.

P3P user agents will allow users to be informed of site practices (in both machine- and human-readable formats) and to automate decision-making based on these practices when appropriate"

Current eGov efforts at W3C

Series of discussions to understand better the needs of Government in deploying current Web standards and the directions that future Web standards should take to best address delivery of Government services.

Contractors

Citizens

Govs

Why Web Standards?

SAVE **I**SO

- Cooperation with the best Web experts
 - saves consulting costs
- Share of R&D costs
 - beyond the resources of a single organization
 - Exchange of ideas an experiences
- Best specifications due to a broad review
- Royalty Free

Share of testing costs

Why Web Standards?

- Open Standards increase innovation and competition
- Growth increase due to market trust
- More Customers trust
 - not tied to proprietary solutions

Short Term Plan

 European Symposium on eGovernment [symposium page, report]

Gijón, Spain, I-2 February 2007

 Toward More Transparent Government: Workshop on eGovernment and the Web [workshop page, call for participation]

Washington DC, USA, 18-19 June 2007

Several interesting findings so far, main ones follow

Best Practices and Methodologies

- the ability of interoperable frameworks is key to improving efficiencies and increasing the value of IT investments
- Foundational technologies based on Web standards, together with best practices for deployment, is the focus of the World Wide Web Consortium's work

Semantic Interoperability

 Lots of initiatives and interoperability frameworks built or in the works

 usually work only in a given context (national, regional...), hard to interoperate between them yet

• Producing XML does not mean being interoperable

- Interoperability is not a technical (only) issue
- <u>Semantic Web</u> approach is powerful, but a few challenges currently perceived:
 - it's not cheap nor easy
 - lack of expertise in the Industry and Governments

Creating a Trust Context

- Privacy and Security are requirements to build trust with citizens to use eGovernment services
- W3C's work in Web Security will help governments to standardize and provide solutions that citizens can understand clearly and trust

We expect more to come

- Workshop in Washington
 - validation of the findings mentioned
 - topics not much explored yet, e.g., dissemination of information...
- Number of Governments using W3C techs is constantly increasing
 - IDABC (EC), REDGEALC (OAS), etc.
- new technologies, old problems, e.g.:
 - mobile phones as enablers of Gov services (e.g. in developing countries)
 - difficult to build an interoperable solution (too many devices, browsers...), see the <u>Mobile Web Initiative (MWI)</u> work

Conclusions

- eGovernment Services increasing sophistication, but "good old problems" not solved yet, e.g., interoperability
- need to explore more to see if those findings are interesting enough for Membership and eGov actors
- need cooperation and skip reinventing the wheel,
 e.g., use cases and best practices
- W3C has a role to play, but we cannot do it alone

(The Good News) eGov can be funny, too!

(The Good News) eGov can be funny, too!
