New Generation TV platform API and Privacy Protection

- Study from Broadcasting Extended Functionalities API in BML -

September 2, 2010

Shuhei Habu

Allied Resources Communications, Inc.

Tokyo, Japan

Background

- User's way of watching video is changing
  - Watching Internet video sites like Youtube, Nicovideo on PC (Nicovideo: online video sharing site in Japan)
  - Searching/browsing related information on mobile handsets or PC during watching TV (multi window style)
  - Watching video using simple user interface of media-player applications on mobile handsets

TV usually has larger screen and simple user interface. So, why don't we enjoy these styles on TV at one stop?

New service/application requirements for TV set

- User prefer to use the following functionalities on TV set,
  - Internet Video such as Youtube
  - VOD (Video on demand)
  - Recording broadcast or user preferences etc.
  - Video phone / Address Book
  - Network games
  - Bookmarks
  - Web mail
  - Calendar
  - SNS Services
  - Etc.

Application execution environment is essential
for wide variety of requirements.

High level requirements for application execution environment on TV set

- The following functionalities are required:
  - Multiple type of media data such as Text, Video, Audio are rendered at the same time
  - Real-time user interaction (for dynamic web contents etc.)
  - Bi-directional communication between TV and service delivery server (video phone, network games, service monitoring etc.)
  - Simple user interface (e.g. conventional remote control)
  - Local storage (for recording broadcast or storing user preferences etc.)
  - Security (for privacy protection etc.)

TV platform is expected to satisfy these requirements to meet users' requirements.

Existing standards or technologies in the world

- TV platforms (just a few of examples)
  - HTML + JavaScript
    - BML, HTML5, DVB-HTML, CE-HTML etc.
  - Java-based
   - ARIB-J, DVB-J etc.
  - Other
    - Flash video, Microsoft TV, Google TV etc.

There are many kinds of TV platforms.

Standards and technologies
in Japan

- In late 1990s, Japanese broadcast industries decided to adopt XML-based standard "BML" as digital TV platform.
- Since around 2005, Youtube and Nicovideo started. People started to talk about web-broadcast convergence. Ways of watching TV and Video contents were becoming more diversified.
- In 2010, HTML5 and related specifications are becoming as good candidates for New Generation TV platform.

	TV (Broadcasting)		**PC (Internet Online Video)**
1990s	**BML + Broadcast Extension API**		Proprietary Video tech. (RealVideo etc.)
Around 2005 - present		Add support of Youtube, acTVila etc.	Flash Video (Youtube, Nicovideo etc.)
Near future	**HTML5?**		**Flash Video/HTML5?**

Users and industries call for standardized TV platform API

Some of users and industries expect that HTML5 would be one of promised platforms for Next Generation Multi-media TV set.

- There are many kinds of TV platforms in the current market. (See slide No.6-7)
- Considerations:
  - Users: bothered to choose right platform meeting their needs
  - Contents Creator/Provider: need stable contents development environment. Now, need to pay extra cost to make their contents to support multiple platforms
  - Manufacturer: Hard to reduce development cost by procurement of common components (re-inventing the wheels)

We believe that standardization activities to
HTML5 incorporating BML functionalities will solve these issues.

BML in brief

- Summary
  - XML-based standard developed by ARIB (Association of Radio Industries and Businesses)
  - Defined in ARIB STD-B24 "Data Coding and Transmission Specification for Digital Broadcasting"
  - Derived from early draft XHTML 1.0 strict (extended and modified), subset CSS 1 and 2, ECMAScript and Broadcast Extensions API
- Revision history:
  - 1999: The first version (1.0) was finalized
  - 2009: The latest version (5.4) was published
- BML Broadcasting Extensions API
  - Can be categorized as the following lines:
    - EPG API
    - VOD/Broadcasting base on Home Server API
    - Storage API
    - Interactive/Presentation API
    - Other TV set Control API

In Japan, BML is time-proven presentation technology
based on XHTML/CSS and JavaScript,
which has been tested by many commercial-grade deployments.
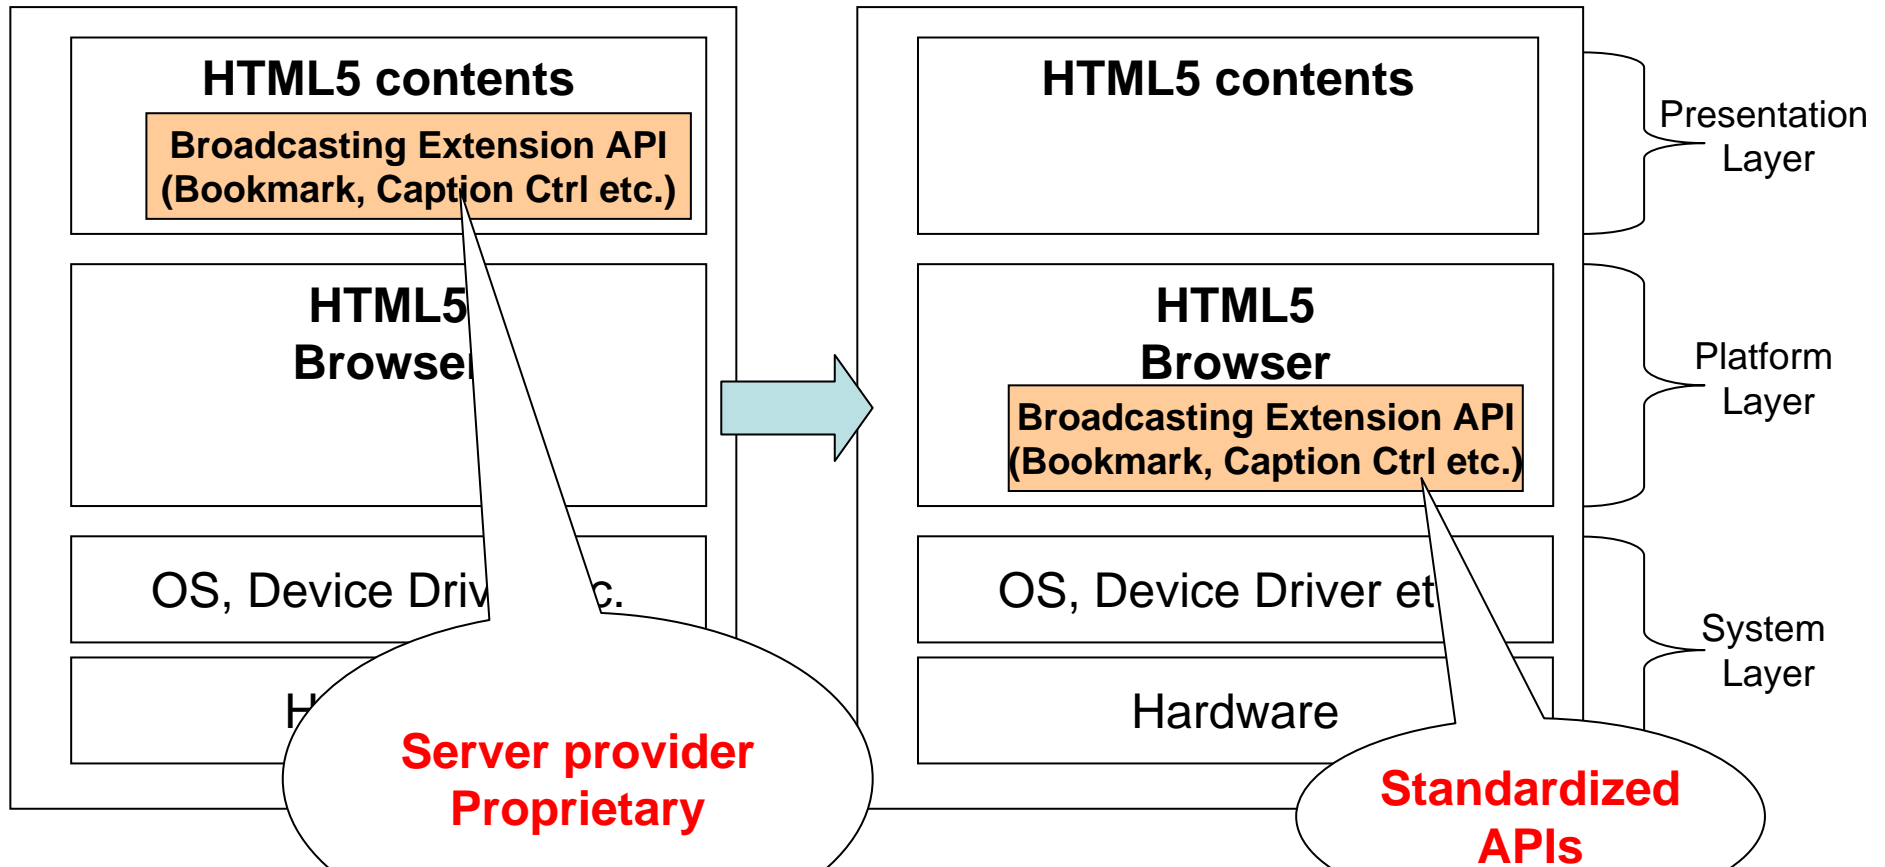

BML vs HTML5 on TV-related functionality

	BML	HTML5 + W3C DAP
Contents Text/Video/Audio	object element with remain attribute	video, audio element
Bi-directional communication	Bi-directional communication APIs	WebSockets
Storage	General-purpose Local Storage	LocalStorage
Bookmark	Bookmark API	None
Printer Control	Printing API	None
Device Control	General-purpose XML-based peripheral control API, printer	None
EPG/Reservation	EPG, Program Index, Series for recording reservation	None
Presentation	Multi-language Caption control, External Characters etc.	Limited (video overlay at WHATWG)

BML provides essential features EPG and caption control etc. for broadcasting contents delivery.

(Yellow: differences between BML and HTML5)

Inside structure of Multi-media TV set

**If HTML5 supports
Broadcasting Extension API:**

HTML5 contents **Broadcasting Extension API** **(Bookmark, Caption Ctrl etc.)**	**HTML5 contents**
HTML5 Browser	**HTML5 Browser** **Broadcasting Extension API** **(Bookmark, Caption Ctrl etc.)**
OS, Device Driver etc.	OS, Device Driver etc.

Server provider Proprietary

Standardized APIs

HTML5 contents become more stable
by standardizing Broadcasting Extension API into HTML5 Browser.

BML – Broadcasting Extensions API

- EPG API
  - EPG (Electronic Program Guide)
  - Program Index
  - Series Reservation
- VOD/Broadcasting base on Home Server API
  - Digital Broadcasting System based on Home Server (unique to Japan)
  - IPTV Control (VOD)
- Storage API
  - Persistent Storage
  - Local Storage (Directory/File System)
  - Registry (Ureg/Greg)

- Interactive/Presentation API
  - Caption Control
  - Bi-directional Communication
  - Browser Controls
  - Play Rom Sound
  - Timer
  - External Character (Gaiji)
- Other TV set Control API
  - Other Functions
  - External peripherals Control
  - Bookmark Control
  - Printing

The latest BML specification defines 229 TV-specific APIs.

EPG (Electronic Program Guide)

- Summary
  - Do or cancel watching/recording reservation to make use of EPG information etc.
- Functions
  - Do or cancel reservation (including reservation confirmation)
  - Get program information (start time, end time, duration) from EPG data
  - Tune in service or other BML document during EPG operation

Receiver/
Recorder

EPG
data

Broadcast station

User

Do or cancel reservation
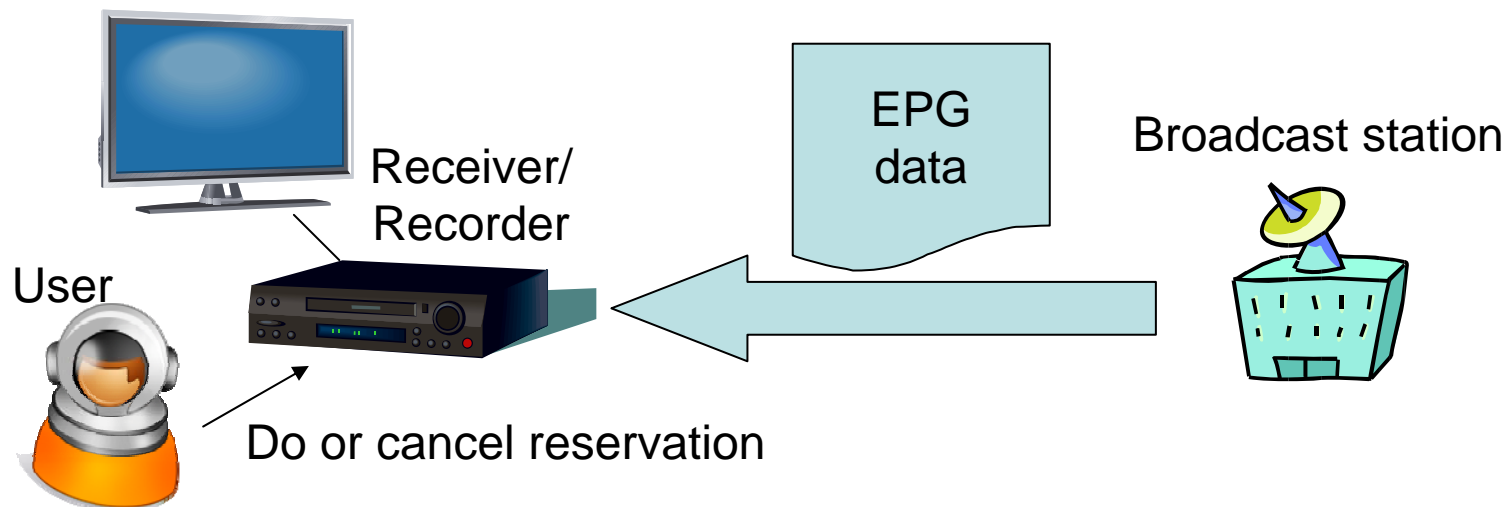

Program Index

- Summary
  - Do or cancel watching/recording reservation on program group basis. Program group is a kind of index data containing a set of program reference IDs. This feature make it simple for users to handle sets of programs.
    - Example: Original air and rerun one, a set of recommended programs etc.
- Functions
  - Do or cancel reservations on program group basis (including reservation confirmation)
  - Get program relation information from EPG data
  - Tune in EPG Display mode using a program group ID

EIT: Event Information Table

Series Reservation

- ## Summary
  - Do or cancel watching/recording reservation on a series basis. Series is a kind of index data containing a set of program reference IDs as a series. This feature make it simple for users to handle sets of programs.
    - Example: Drama series etc.

- ## Functions
  - Do or cancel watching/recording reservations on a series basis (including reservation confirmation)

# VOD/Broadcasting base on Home Server API

- Digital Broadcasting System based on Home Server (unique to Japan)
- IPTV Control (VOD)

VOD/Broadcasting based on Home Server API

- Summary
  - Controls VOD (Video On Demand) service from script programs in BML document.
  - In addition to ordinary VOD, supports Broadcasting based on Home Server [ARIB TR-B27] (unique to Japan)
- Functions
  - VOD API:
    - Get download-control information before starting VOD service
    - launch resident VOD application to play contents
  - Broadcasting based on Home Server:
    - Recording reservation, on-demand recording by user operation, license management of contents, CAS management, playback control, contents metadata control etc.

VOD API example:

This API enables flexible front-end service for VOD,

which can be used for network affiliation etc.

VOD Server

User

Controlling VOD Service

TV set

BML Document (Script Program)

BML Browser

Resident VOD Application

Local Storage
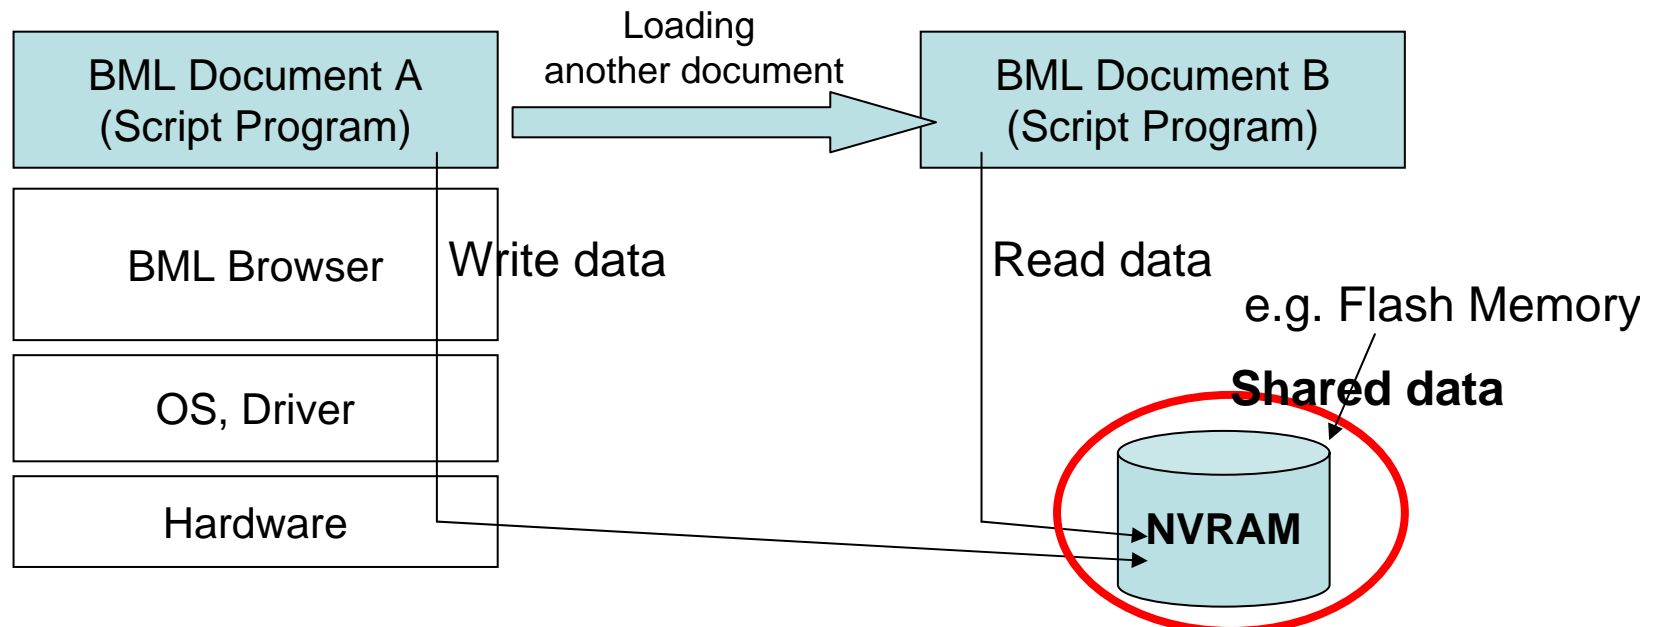

Play Contents

Download VOD contents

Storage API

- Persistent Storage
- Local Storage (Directory/File System)
- Registry (Ureg/Greg)

Persistent Storage

- Summary
  - Share data among different contents (BML documents) to store small chunk of data on a low-capacity storage like NVRAM (Non Volatile RAM) embedded in a receiver. For example, location, game score etc.

- Functions
  - Read/write data (String, Number, Array) on a low-capacity storage or copy/delete
  - Get the list of stored data
  - Get the total amount of free memory space in the receiver

| BML Document A (Script Program)	Loading another document →	BML Document B (Script Program)
BML Browser	Write data	Read data
OS, Driver		e.g. Flash Memory
Hardware		**Shared data**

NVRAM

Persistent Storage with Access Control

- Summary
  - Share data with Access check among different contents (BML documents) to store small chunk of data on a low-capacity storage like NVRAM (Non Volatile RAM) embedded in a receiver. For example, location, game score etc.

- Functions
  - Read/write data (Array only) on a low-capacity storage with Access check
 - Set Access check info on stored data

BML Document A (Script Program)	Loading another document →	**BML Document B** (Script Program)

BML Browser

Write data **with Access check**

Read data **with Access check**

OS, Driver

If not permitted, Access denied.

Hardware

NVRAM

Local Storage (Directory/File System)

- ## Summary
  - Make contents more accessible and convenient for later-use to store broadcasting contents, BML documents and carousel data on local storage embedded in a receiver

- ## Functions
  - Read/write files and create directories
  - Copy directories/files and other operations
  - Get information (type, number, name, free space) about local storage
  - No delete/move operation or Access check mechanism

BML Document (Script Program)	Later on … →	BML Document (Script Program)

BML Browser

Create file or directory to store data

Read data

e.g. Hard Disk

OS, Driver

Stored data

Hardware

Local Storage

Registry (Ureg/Greg)

- Summary
  - Ureg/Greg are small shared memories on a TV set supporting BML. It is provided as variables directly accessed in ECMAScript code, not through API.
  - It is used for sharing temporary data (text) among multiple BML documents.
  - Ureg: keeps data until user change the channel t another.
  - Greg: keeps data until TV set is rebooted.
- Functions
  - Read/write 64 text data in array (256 Bytes for each)
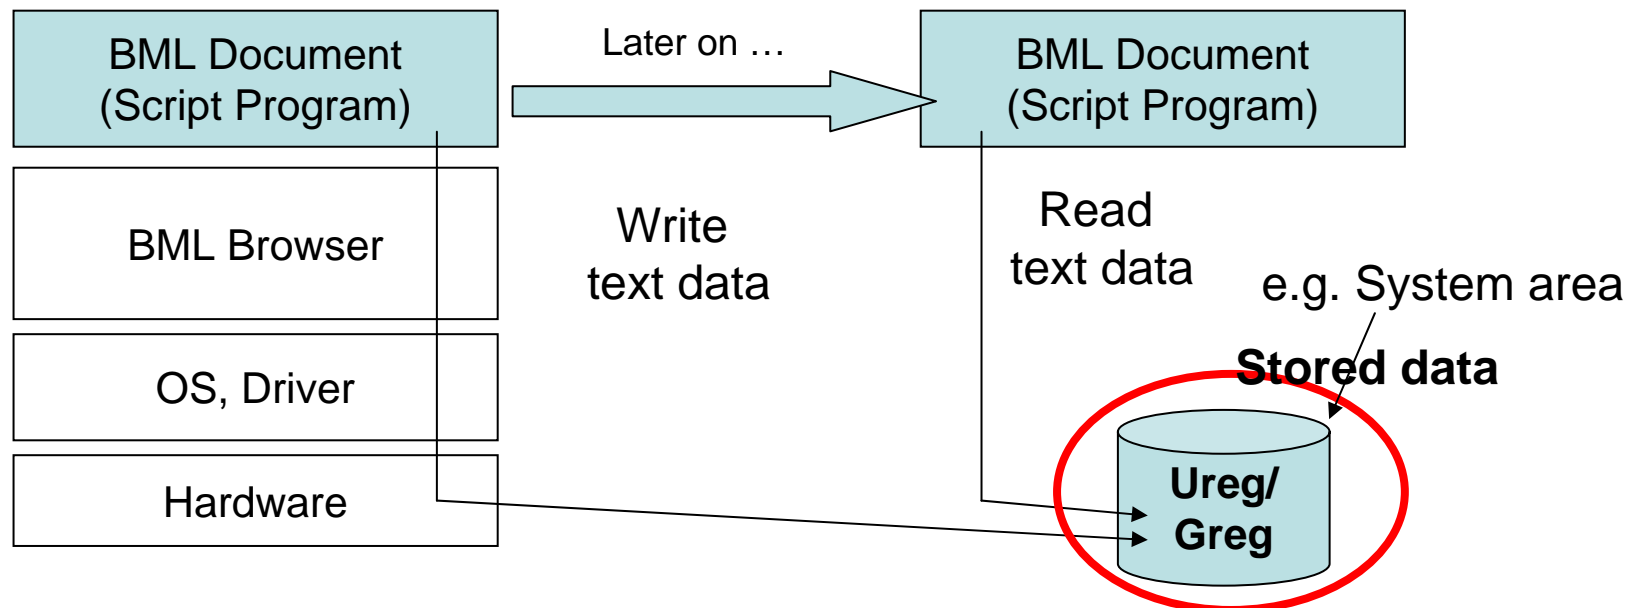

Interactive/Presentation API

- Caption Control
- Bi-directional Communication
- Browser Controls
- Play Rom Sound
- Timer
- External Character (Gaiji)
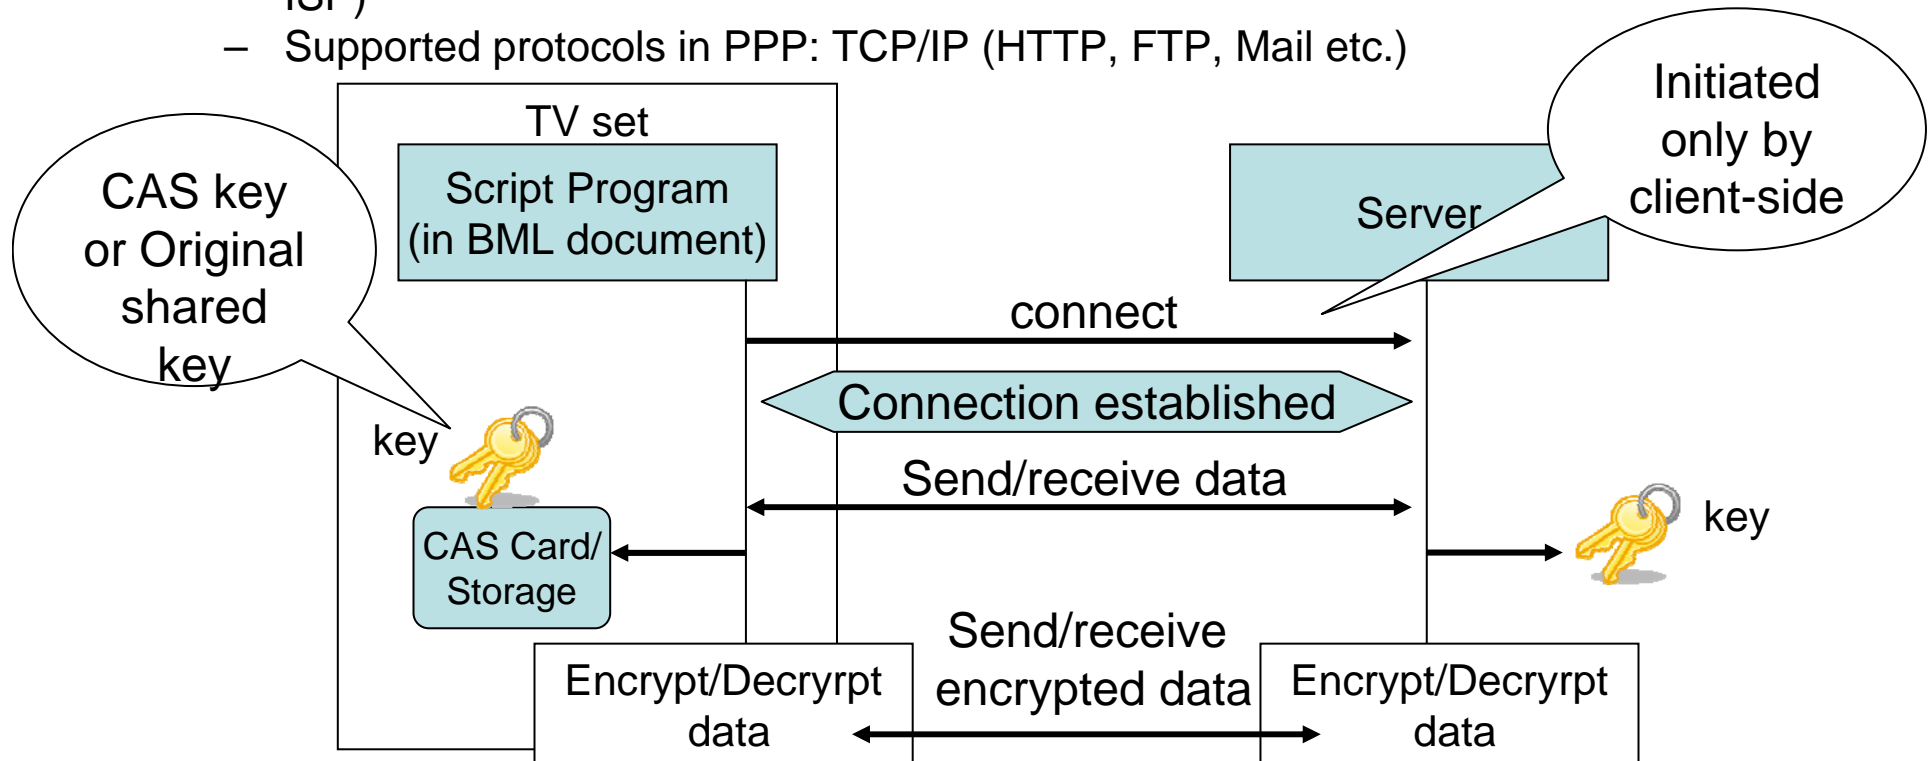

Caption Control

- Summary
  - Control closed caption display
- Functions
  - Select a closed caption (CC) component stream
  - Get a URI of selected CC component stream
  - Switch CC display status (On/Off) by language
  - Get the current CC display status
  - Etc.

Will it rain tomorrow?

CC display status: On
Language: Japanese

Bi-directional Communication

- Summary
  - Send and receive Text or Binary data between TV set and Server on the network. A script in the BML document can control bi-directional communication channel.
- Functions
  - Connect/Disconnect to a server/network
  - Send/receive text or binary data
  - Encryption supported (using a key registered in CAS card, or an original shared key)
  - Suuported connection types: Basic Procedure (e.g. x.28) over PSTN or PPP(via ISP)
  - Supported protocols in PPP: TCP/IP (HTTP, FTP, Mail etc.)

CAS key or Original shared key

Initiated only by client-side

Send/receive encrypted data

Encrypt/Decryrpt data

Browser Controls

- Summary
  - Bring some actions to browser
  - Get browser preference/status and its capabilities through the APIs.
- Functions
  - Get unique identifier of TV set, browser version, list of supported capabilities, currently executed program ID, URL of active document,
  - Change display area of browser on the full TV screen
  - Reload or quit the active document
  - Launch documents/applications or resident applications
  - Exit the current browser and launch another browser
  - Etc. (Browser Controls defines a lot of APIs except for the listed above)

Play Rom Sound

- Summary
  - Play sound data stored on TV set
- Functions
  - Star to play sound data by passing sound ID
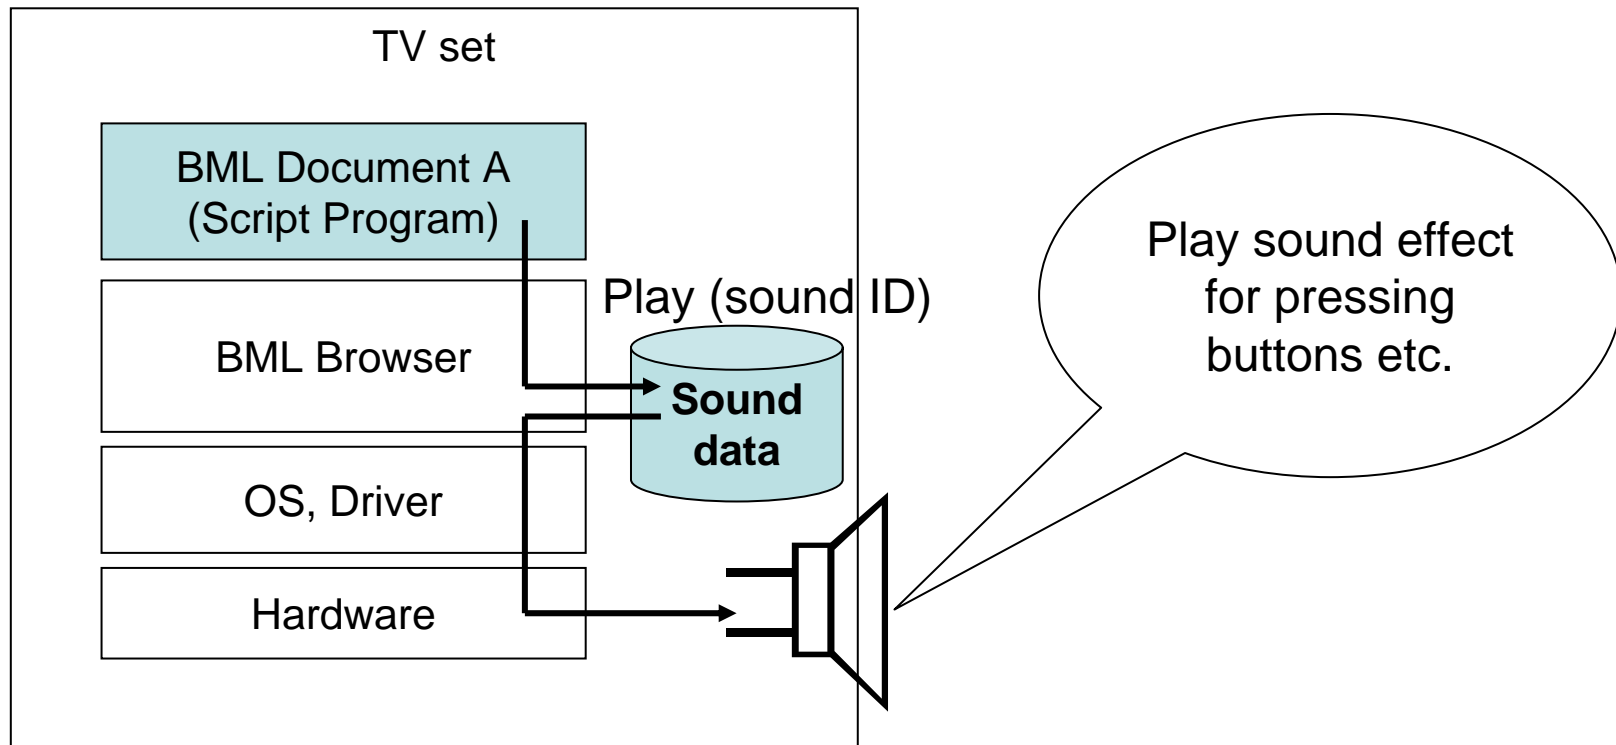

Timer

- Summary
  - Extends the original JavaScript Timer API to provides sleep, pause, resume.
  - There are only setTimeout() and setInterval in the original JavaScript specification. So, coders usually implement their own sleep() to do a trick. This sometimes affects browser performance.
- Functions
  - Do sleep
  - Execute some code after a specified time-interval (milliseconds)
  - Keep triggering some code again and again

External Character (Gaiji)

- Summary
  - Manage external character setting on TV set to download its setting file from online server
- Functions
  - Set new external character setting by passing URL to setting file stored on the network
  - Clear the current external character settings

Pictorial characters etc. other than system-registered standard characters

Other TV set Control API

- Other Functions
- External peripherals Control
- Bookmark Control
- Printing

Other Functions

- ## Summary
  - Provides convenient tools for programmers to build their multi-media contents. For example, manipulating date, formatting number, make random number etc. These tools are not provided by the original JavaScript API.

- ## Functions
  - Manipulate date type variables. e.g. subdate(), adddate()
  - Format numerical type variables. e.g. insert "," in every three digits for representing $ or Yen
External peripherals Control

- Summary
  - Communicate with external peripherals (eg. Camera, NAS) connected to TV set. It doesn't depend on specific type of device or physical transports. This API provides general-purpose command/read data API and device-enumeration API.

- Functions
  - Enumerate currently available devices connected TV set
  - Send commands (described as an XML document) to external devices
  - Read date (formatted as an array) from external devices

Camera for
Video phone

TV set

Start/Stop capturing

Command
Data
(XML)

NAS
（Recorder）

Record broadcast/
Play recorded data
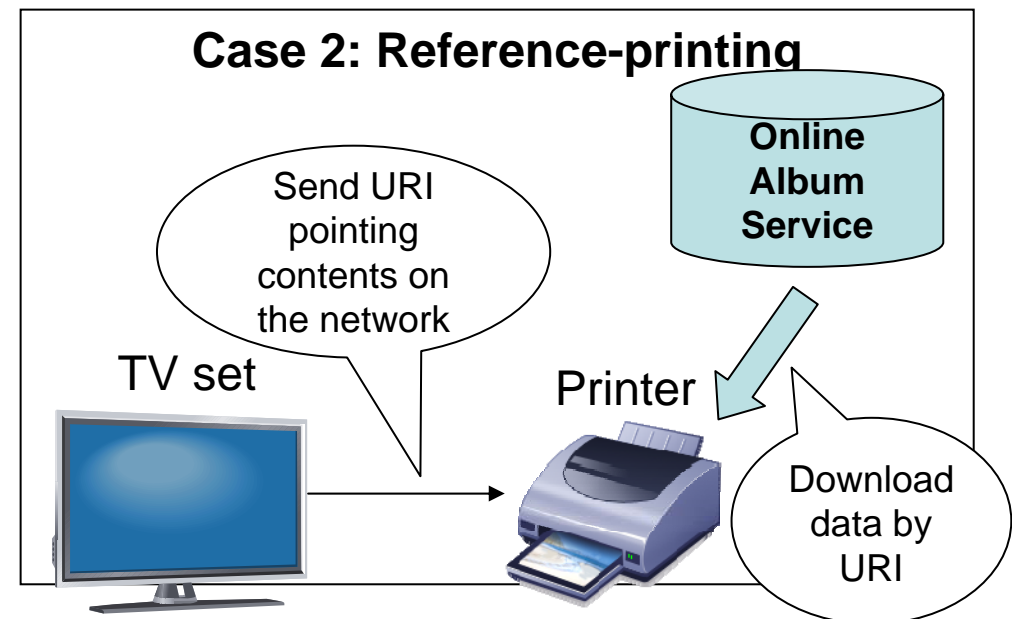

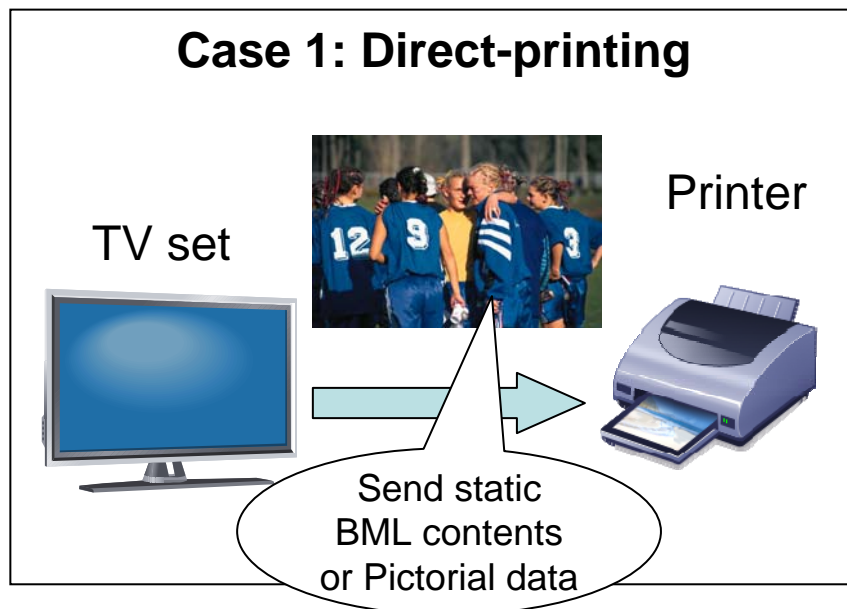

Bookmark Control

- Summary
  - Enable script programs in BML documents to manage bookmark list with preferences. Each bookmark data can contain Expire date, Media Type etc. as well as basic information Title, URL.

- Functions
  - Read/Write bookmark data
  - Lock/unlock bookmark list to avoid unintended removal by users or programs
  - Delete bookmark data
 - Launch resident bookmark application
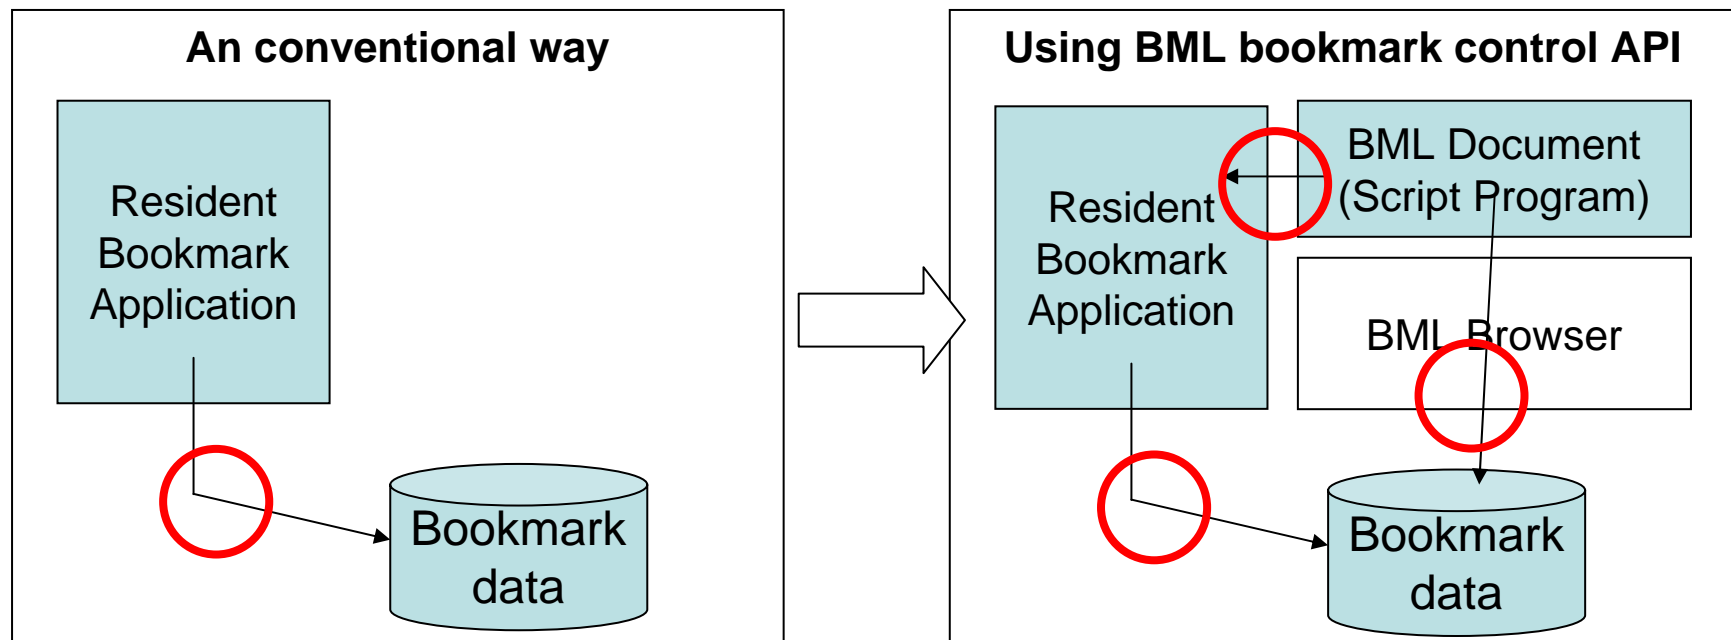

Printing

- Summary
  - Print static BML contents or images using printing device in home network.
  - This API supports both Direct-printing and Reference-printing.
  - In addition, save images on the inserted Memory Card.

- Functions
  - Send print commands to printing devices passing contents data or URIs pointing contents on the network.
  - Store image data on Memory Card

Case 1: Direct-printing

TV set

Printer

Send static BML contents or Pictorial data

Case 2: Reference-printing

Online Album Service

Send URI pointing contents on the network

TV set

Printer

Download data by URI

Potential Privacy issues in TV platform APIs

TV platform API is useful and powerful to handle contents and data,
writing/reading and sending it through the network.
On the other hand, if security management is poor,
these APIs can also be exposed to
exploitations by malicious contents loaded on the platform.

①Download
Malicious contents

TV set

BML Document
(**Malicious Program**)

BML Browser

②Read

contacts
etc.

Privacy Information stored on TV

- EPG-related data selection history
- Recorded broadcast contents and its metadata
- Contacts for Video phone etc.
- Bookmarks
- Visited pages (browsing history)
- Location (postal address etc.)
- Etc.

The common privacy protection framework
is preferable to application execution environment.

Privacy protection solution
- Policy-based Access Control Framework -

Example: Applying XACML to TV platform API

Broadcaster/
Operator etc.

Conclusions and Proposal

- We propose that W3C should do the following actions in Web on TV:
  - Start from the API functionalities requirement extracting from time-proven TV platform API such as BML
  - Consider applying policy-based access control framework to TV platform API for user privacy data protection
