---

## Abstract

This specification defines the Document Object Model Validation Level 3, a platform- and language-neutral interface. This module provides the guidance to programs and scripts to dynamically update the content and the structure of documents while ensuring that the document remains valid, or to ensure that the document becomes valid.

## Status of this document

*This section describes the status of this document at the time of its publication. Other documents may supersede this document. A list of current W3C publications and the latest revision of this technical report can be found in the W3C technical reports index at <http://www.w3.org/TR/>.*

This is the Proposed Recommendation specification of "DOM Level 3 Validation". This version is based on the feedback during the Candidate Recommendation period. W3C Advisory Committee Members are invited to send formal review comments to the W3C Team-only list [dom-review@w3.org](mailto:dom-review@w3.org) until 14 January 2004, 11pm EDT. The public is also invited to send comments on this document to the public mailing list [www-dom@w3.org](mailto:www-dom@w3.org). An archive is available at <http://lists.w3.org/Archives/Public/www-dom/>.

An implementation report is also available.

This is a draft document and may be updated, replaced or obsoleted by other documents at any time. It is inappropriate to use W3C Working Drafts as reference material or to cite them as other than "work in progress". This is work in progress and does not imply endorsement by, or the consensus of, either W3C or participants of the DOM working group.

This document has been produced as part of the W3C DOM Activity. The authors of this document are the DOM Working Group participants.

Patent disclosures relevant to this specification may be found on the Working Group's patent disclosure page.

# W3C Copyright Notices and Licenses

**Copyright © 2003 World Wide Web Consortium, (Massachusetts Institute of Technology, European Research Consortium for Informatics and Mathematics, Keio University). All Rights Reserved.**

This document is published under the W3C<sup>®</sup> Document Copyright Notice and License [p.5] . The bindings within this document are published under the W3C<sup>®</sup> Software Copyright Notice and License [p.6] . The software license requires "Notice of any changes or modifications to the W3C files, including the date changes were made." Consequently, modified versions of the DOM bindings must document that they do not conform to the W3C standard; in the case of the IDL definitions, the pragma prefix can no longer be 'w3c.org'; in the case of the Java language binding, the package names can no longer be in the 'org.w3c' package.

---

# 1. Validation

*Editors:*

Ben Chang, Oracle

Joe Kesselman, IBM (until September 2001)

Rezaur Rahman, Intel Corporation (until July 2001)

## 1.1 Overview

This chapter describes the optional DOM Level 3 Validation feature. This module provides Application Programming Interfaces (APIs) to guide construction and editing of XML documents. Examples of such guided editing are queries like those that combine questions like "what does the schema allow me to insert/delete here" and "if I insert/delete here, will the document still be valid."

To aid users in the editing and creation of XML documents, other queries may expose different levels of details, e.g., all the possible children, those which would be valid given what precedes this point, lists of defined symbols of a given kind. Some of these queries would prompt checks and warn users if they're about to conflict with or overwrite such data.

Finally, users would like to validate an edited or newly constructed document before serializing it or passing it to other users. They may edit, come up with an invalid document, then edit again to result in a valid document. During this process, these APIs can allow the user to check the validity of the document or subtree on demand. If necessary, these APIs can also require that the document or subtree remain valid during this editing process via the `DocumentEditVal.continuousValidityChecking` flag.

A DOM application can use the `hasFeature(feature, version)` method of the `DOMImplementation` interface to determine with parameter values "Validation" and "3.0", respectively, whether or not these interfaces are supported by the implementation. This implementation is dependent on [DOM Level 2 Core] and the [DOM Level 3 Core] `DOMConfiguration` interface.

This chapter focuses on the editing aspects used in the XML document editing world and usage of such information. The appendix describes in detail all the possible outcomes of the validation operations on the different node types.

## 1.2 Exceptions

This section describes the "VAL-DOC-EDIT" exceptions.

### **Exception *ExceptionVAL***

Some Validation operations may throw an `ExceptionVAL` [p.9] as described in their descriptions.

#### **IDL Definition**

```

exception ExceptionVAL {
    unsigned short    code;
};
// ExceptionVALCode
const unsigned short    NO_SCHEMA_AVAILABLE_ERR    = 71;

```

### Definition group *ExceptionVALCode*

An integer indicating the type of error generated.

#### Defined Constants

NO\_SCHEMA\_AVAILABLE\_ERR

This error occurs when the operation cannot complete due to an unavailable schema [p.41].

## 1.3 Document Editing Interfaces

This section contains "Document Editing" methods as described in the `DocumentEditVAL` [p.10], `NodeEditVAL` [p.11], `ElementEditVAL` [p.14], and `CharacterDataEditVAL` [p.19] interfaces. References to new [DOM Level 3 Core] interfaces such as `DOMStringList` and `NameList` also exist. With the latter interface, if the schema is a DTD, the element information item names are simply local names; if the schema is a W3C XML schema, the names are qualified names, which may contain namespace prefixes.

### Interface *DocumentEditVAL*

This interface extends the `NodeEditVAL` [p.11] interface with additional methods for document editing. An object implementing this interface must also implement the `Document` interface.

#### IDL Definition

```

interface DocumentEditVAL : NodeEditVAL {
    attribute boolean    continuousValidityChecking;
                                // raises(DOMException,
                                //      ExceptionVAL,
                                //      DOMException) on setting

    readonly attribute DOMConfiguration domConfig;
    NameList    getDefinedElements(in DOMString namespaceURI);
    unsigned short    validateDocument();
};

```

#### Attributes

`continuousValidityChecking` of type `boolean`

An attribute specifying whether the validity of the document is continuously enforced.

When the attribute is set to `true`, the implementation may raise certain exceptions, depending on the situation (see the following). This attribute is `false` by default.

#### Exceptions on setting

DOMException	NOT_SUPPORTED_ERR: Raised if the implementation does not support setting this attribute to <code>true</code> .
ExceptionVAL [p.9]	NO_SCHEMA_AVAILABLE_ERR: Raised if this attribute is set to <code>true</code> and a schema is unavailable.
DOMException	VALIDATION_ERR: Raised if an operation makes this document not compliant with the <code>VAL_INCOMPLETE</code> validity type or the document is invalid, and this attribute is set to <code>true</code> .

`domConfig` of type `DOMConfiguration`, readonly

This allows the setting of the error handler, as described in the [DOM Level 3 Core] `DOMConfiguration` interface. An object implementing this `DocumentEditVAL` interface and the [DOM Level 3 Core] `Document` interface, which also has a `domConfig` attribute, needs to only implement this attribute once.

### Methods

`getDefinedElements`

Returns list of all element information item names of global declaration [p.41], belonging to the specified namespace.

#### Parameters

`namespaceURI` of type `DOMString`  
`namespaceURI` of namespace. For DTDs, this is `null`.

#### Return Value

`NameList` List of all element information item names belonging to the specified namespace or `null` if no schema is available.

### No Exceptions

`validateDocument`

Validates the document against the schema, e.g., a DTD or an W3C XML schema or another. Any attempt to modify any part of the document while validating results in implementation-dependent behavior. In addition, the validation operation itself cannot modify the document, e.g., for default attributes. This method makes use of the error handler, as described in the [DOM Level 3 Core] `DOMConfiguration` interface, with all errors being `SEVERITY_ERROR` as defined in the `DOMError` interface.

#### Return Value

`unsigned short` A validation state [p.12] constant.

### No Parameters

### No Exceptions

## Interface *NodeEditVAL*

This interface is similar to the [DOM Level 3 Core] Node interface, with methods for guided document editing.

### IDL Definition

```
interface NodeEditVAL {

    // validationType
    const unsigned short      VAL_WF                = 1;
    const unsigned short      VAL_NS_WF            = 2;
    const unsigned short      VAL_INCOMPLETE        = 3;
    const unsigned short      VAL_SCHEMA           = 4;

    // validationState
    const unsigned short      VAL_TRUE             = 5;
    const unsigned short      VAL_FALSE           = 6;
    const unsigned short      VAL_UNKNOWN         = 7;

    readonly attribute DOMString      defaultValue;
    readonly attribute DOMStringList  enumeratedValues;
    unsigned short      canInsertBefore(in Node newChild,
                                       in Node refChild);
    unsigned short      canRemoveChild(in Node oldChild);
    unsigned short      canReplaceChild(in Node newChild,
                                       in Node oldChild);
    unsigned short      canAppendChild(in Node newChild);
    unsigned short      nodeValidity(in unsigned short valType);
};
```

### Definition group *validationType*

An integer indicating the validation type. Other specifications can define stricter validation types/constants by extending the NodeEditVAL interface.

#### Defined Constants

VAL\_INCOMPLETE

Check if the node's immediate children are those expected by the content model. This node's trailing required children could be missing. It includes VAL\_NS\_WF.

VAL\_NS\_WF

Check if the node is namespace well-formed [p.41] .

VAL\_SCHEMA

Check if the node's entire subtree are those expected by the content model. It includes VAL\_NS\_WF.

VAL\_WF

Check if the node is well-formed [p.41] .

### Definition group *validationState*

An integer indicating the validation state, or whether the operation can or cannot be done.

#### Defined Constants

VAL\_FALSE

False if the node is invalid with regards to the operation, or if the operation cannot be done.

VAL\_TRUE

True if the node is valid with regards to the operation, or if the operation can be done.

VAL\_UNKNOWN

The validity of the node is unknown.

### Attributes

defaultValue of type DOMString, readonly

The default value specified in an attribute or an element declaration or null if unspecified. If the schema is a W3C XML schema, this is the canonical lexical representation of the default value.

enumeratedValues of type DOMStringList, readonly

A DOMStringList, as described in [DOM Level 3 Core], of distinct values for an attribute or an element declaration or null if unspecified. If the schema is a W3C XML schema, this is a list of strings which are lexical representations corresponding to the values in the [value] property of the enumeration component for the type of the attribute or element. It is recommended that the canonical lexical representations of the values be used.

### Methods

canAppendChild

Determines whether the Node.appendChild operation would make this document not compliant with the VAL\_INCOMPLETE validity type.

#### Parameters

newChild of type Node

Node to be appended.

#### Return Value

unsigned short A validation state [p.12] constant.

### No Exceptions

canInsertBefore

Determines whether the Node.insertBefore operation would make this document not compliant with the VAL\_INCOMPLETE validity type.

#### Parameters

newChild of type Node

Node to be inserted.

refChild of type Node

Reference Node.

#### Return Value

unsigned short A validation state [p.12] constant.

### No Exceptions

canRemoveChild

Determines whether the Node.removeChild operation would make this document not compliant with the VAL\_INCOMPLETE validity type.

#### Parameters

oldChild of type Node  
Node to be removed.

**Return Value**

unsigned short A validation state [p.12] constant.

**No Exceptions**

canReplaceChild

Determines whether the Node.replaceChild operation would make this document not compliant with the VAL\_INCOMPLETE validity type.

**Parameters**

newChild of type Node  
New Node.

oldChild of type Node  
Node to be replaced.

**Return Value**

unsigned short A validation state [p.12] constant.

**No Exceptions**

nodeValidity

Determines if the node is valid relative to the validation type [p.12] specified in valType. This operation doesn't normalize before checking if it is valid. To do so, one would need to explicitly call a normalize method. The difference between this method and the DocumentEditVAL.validateDocument [p.11] method is that the latter method only checks to determine whether the entire document is valid.

**Parameters**

valType of type unsigned short  
Flag to indicate the validation type [p.12] checking to be done.

**Return Value**

unsigned short A validation state [p.12] constant.

**No Exceptions**

**Interface *ElementEditVAL***

This interface extends the NodeEditVAL [p.11] interface with additional methods for guided document editing. An object implementing this interface must also implement the Element interface.

This interface also has attributes that are a NameList of elements or attributes which can appear in the specified context. Some schema languages, i.e., W3C XML schema, define wildcards which provide for validation of attribute and element information items dependent on their namespace names but independent of their local names.

To expose wildcards, the `NameList` returns the values that represent the namespace constraint:

- `{namespaceURI, name}` is `{null, ##any}` if *any*;
- `{namespaceURI, name}` is `{namespace_a, ##other}` if *not and a namespace name (namespace\_a)*;
- `{namespaceURI, name}` is `{null, ##other}` if *not and absent*;
- Pairs of `{namespaceURI, name}` with values `{a_namespaceURI | null, null}` if *a set whose members are either namespace names or absent*.

### IDL Definition

```
interface ElementEditVAL : NodeEditVAL {

    // ContentTypeVAL
    const unsigned short    VAL_EMPTY_CONTENTTYPE        = 1;
    const unsigned short    VAL_ANY_CONTENTTYPE          = 2;
    const unsigned short    VAL_MIXED_CONTENTTYPE        = 3;
    const unsigned short    VAL_ELEMENTS_CONTENTTYPE     = 4;
    const unsigned short    VAL_SIMPLE_CONTENTTYPE       = 5;

    readonly attribute NameList    allowedChildren;
    readonly attribute NameList    allowedFirstChildren;
    readonly attribute NameList    allowedParents;
    readonly attribute NameList    allowedNextSiblings;
    readonly attribute NameList    allowedPreviousSiblings;
    readonly attribute NameList    allowedAttributes;
    readonly attribute NameList    requiredAttributes;
    readonly attribute unsigned short contentType;
    unsigned short    canSetTextContent(in DOMString possibleTextContent);
    unsigned short    canSetAttribute(in DOMString attrname,
                                     in DOMString attrval);
    unsigned short    canSetAttributeNode(in Attr attrNode);
    unsigned short    canSetAttributeNS(in DOMString namespaceURI,
                                       in DOMString qualifiedName,
                                       in DOMString value);
    unsigned short    canRemoveAttribute(in DOMString attrname);
    unsigned short    canRemoveAttributeNS(in DOMString namespaceURI,
                                          in DOMString localName);
    unsigned short    canRemoveAttributeNode(in Node attrNode);
    unsigned short    isElementDefined(in DOMString name);
    unsigned short    isElementDefinedNS(in DOMString namespaceURI,
                                         in DOMString name);
};
```

### Definition group *ContentTypeVAL*

An integer indicating the content type of an element.

#### Defined Constants

`VAL_ANY_CONTENTTYPE`

The content model contains unordered child information item(s), i.e., element, processing instruction, unexpanded entity reference, character, and comment information items as defined in the XML Information Set. If the schema is a DTD, this corresponds to the ANY content model.

**VAL\_ELEMENTS\_CONTENTTYPE**

The content model contains a sequence of element information items optionally separated by whitespace. If the schema is a DTD, this is the `element content` content model; and if the schema is a W3C XML schema, this is the `element-only content` type.

**VAL\_EMPTY\_CONTENTTYPE**

The content model does not allow any content. If the schema is a W3C XML schema, this corresponds to the `empty` content type; and if the schema is a DTD, this corresponds to the `EMPTY` content model.

**VAL\_MIXED\_CONTENTTYPE**

The content model contains a sequence of ordered element information items optionally interspersed with character data. If the schema is a W3C XML schema, this corresponds to the `mixed` content type.

**VAL\_SIMPLE\_CONTENTTYPE**

The content model contains character information items. If the schema is a W3C XML schema, then the element has a content type of `VAL_SIMPLE_CONTENTTYPE` if the type of the element is a `simple type definition`, or the type of the element is a `complexType` whose `{content type}` is a `simple type definition`.

**Attributes**

`allowedAttributes` of type `NameList`, `readonly`

A `NameList`, as described in [DOM Level 3 Core], of all possible attribute information items or wildcards [p.14] that can appear as attributes of this element, or `null` if this element has no context or schema. Duplicate pairs of `{namespaceURI, name}` are eliminated.

`allowedChildren` of type `NameList`, `readonly`

A `NameList`, as described in [DOM Level 3 Core], of all possible element information items or wildcards [p.14] that can appear as children of this element, or `null` if this element has no context or schema. Duplicate pairs of `{namespaceURI, name}` are eliminated.

`allowedFirstChild` of type `NameList`, `readonly`

A `NameList`, as described in [DOM Level 3 Core], of all possible element information items or wildcards [p.14] that can appear as a first child of this element, or `null` if this element has no context or schema. Duplicate pairs of `{namespaceURI, name}` are eliminated.

`allowedNextSiblings` of type `NameList`, `readonly`

A `NameList`, as described in [DOM Level 3 Core], of all element information items or wildcards [p.14] that can be inserted as a next sibling of this element, or `null` if this element has no context or schema. Duplicate pairs of `{namespaceURI, name}` are eliminated.

`allowedParents` of type `NameList`, `readonly`

A `NameList`, as described in [DOM Level 3 Core], of all possible element information items that can appear as a parent this element, or `null` if this element has no context or schema.

`allowedPreviousSiblings` of type `NameList`, `readonly`

A `NameList`, as described in [DOM Level 3 Core], of all element information items or wildcards [p.14] that can be inserted as a previous sibling of this element, or `null` if this

element has no context or schema.

`contentType` of type `unsigned short`, readonly

The content type of an element as defined above [p.15] .

`requiredAttributes` of type `NameList`, readonly

A `NameList`, as described in [DOM Level 3 Core], of required attribute information items that must appear on this element, or `null` if this element has no context or schema.

## Methods

`canRemoveAttribute`

Verifies if an attribute by the given name can be removed.

### Parameters

`attrname` of type `DOMString`

Name of attribute.

### Return Value

`unsigned short` A validation state [p.12] constant.

### No Exceptions

`canRemoveAttributeNS`

Verifies if an attribute by the given local name and namespace can be removed.

### Parameters

`namespaceURI` of type `DOMString`

The namespace URI of the attribute to remove.

`localName` of type `DOMString`

Local name of the attribute to be removed.

### Return Value

`unsigned short` A validation state [p.12] constant.

### No Exceptions

`canRemoveAttributeNode`

Determines if an attribute node can be removed.

### Parameters

`attrNode` of type `Node`

The `Attr` node to remove from the attribute list.

### Return Value

`unsigned short` A validation state [p.12] constant.

### No Exceptions

`canSetAttribute`

Determines if the value for specified attribute can be set.

### Parameters

`attrname` of type `DOMString`

Name of attribute.

attrval of type DOMString

Value to be assigned to the attribute.

**Return Value**

unsigned short A validation state [p.12] constant.

**No Exceptions**

canSetAttributeNS

Determines if the attribute with given namespace and qualified name can be created if not already present in the attribute list of the element. If the attribute with the same qualified name and namespaceURI is already present in the element's attribute list, it tests whether the value of the attribute and its prefix can be set to the new value.

**Parameters**

namespaceURI of type DOMString

namespaceURI of namespace.

qualifiedName of type DOMString

Qualified name of attribute.

value of type DOMString

Value to be assigned to the attribute.

**Return Value**

unsigned short A validation state [p.12] constant.

**No Exceptions**

canSetAttributeNode

Determines if an attribute node can be added.

**Parameters**

attrNode of type Attr

Node in which the attribute can possibly be set.

**Return Value**

unsigned short A validation state [p.12] constant.

**No Exceptions**

canSetTextContent

Determines if the text content of this node and its descendants can be set to the string passed in.

**Parameters**

possibleTextContent of type DOMString

Possible text content string.

**Return Value**

unsigned short A validation state [p.12] constant.

**No Exceptions**`isElementDefined`

Determines if name is defined in the schema. This only applies to global declarations [p.41] . This method is for non-namespace aware schemas.

**Parameters**

name of type DOMString

Name of element.

**Return Value**

unsigned short    A validation state [p.12] constant.

**No Exceptions**`isElementDefinedNS`

Determines if name in this namespace is defined in the current context. Thus not only does this apply to global declarations [p.41] . but depending on the content, this may also apply to local definitions. This method is for namespace aware schemas.

**Parameters**

namespaceURI of type DOMString

namespaceURI of namespace.

name of type DOMString

Name of element.

**Return Value**

unsigned short    A validation state [p.12] constant.

**No Exceptions****Interface *CharacterDataEditVAL***

This interface extends the `NodeEditVAL` [p.11] interface with additional methods for document editing. An object implementing this interface must also implement `CharacterData` interface. When validating `CharacterData` nodes, the `NodeEditVAL.nodeValidity` [p.14] operation must find the nearest parent node in order to do this; if no parent node is found, `VAL_UNKNOWN` [p.13] is returned. In addition, when `VAL_INCOMPLETE` [p.12] is passed in as an argument to the `NodeEditVAL.nodeValidity` [p.14] operation to operate on such nodes, the operation considers all the text and not just some of it.

**IDL Definition**

```
interface CharacterDataEditVAL : NodeEditVAL {
    unsigned short    isWhitespaceOnly();
    unsigned short    canSetData(in DOMString arg);
    unsigned short    canAppendData(in DOMString arg);
    unsigned short    canReplaceData(in unsigned long offset,
                                     in unsigned long count,
                                     in DOMString arg)
                                     raises(DOMException);
    unsigned short    canInsertData(in unsigned long offset,
                                    in DOMString arg)
                                    raises(DOMException);
}
```

```

unsigned short    canDeleteData(in unsigned long offset,
                                in unsigned long count)
                                raises(DOMException);
};

```

**Methods**

canAppendData

Determines if character data can be appended.

**Parameters**

arg of type DOMString

Data to be appended.

**Return Value**

unsigned short A validation state [p.12] constant.

**No Exceptions**

canDeleteData

Determines if character data can be deleted.

**Parameters**

offset of type unsigned long

Offset.

count of type unsigned long

Number of 16-bit units to delete.

**Return Value**

unsigned short A validation state [p.12] constant.

**Exceptions**

DOMException INDEX\_SIZE\_ERR: Raised if the specified offset is negative or greater than the number of 16-bit units in data, or if the specified count is negative.

canInsertData

Determines if character data can be inserted.

**Parameters**

offset of type unsigned long

Offset.

arg of type DOMString

Argument to be set.

**Return Value**

unsigned short A validation state [p.12] constant.

### Exceptions

DOMException INDEX\_SIZE\_ERR: Raised if the specified offset is negative or greater than the number of 16-bit units in data.

#### canReplaceData

Determines if character data can be replaced.

##### Parameters

offset of type unsigned long

Offset.

count of type unsigned long

Replacement.

arg of type DOMString

Argument to be set.

##### Return Value

unsigned short A validation state [p.12] constant.

### Exceptions

DOMException INDEX\_SIZE\_ERR: Raised if the specified offset is negative or greater than the number of 16-bit units in data, or if the specified count is negative.

#### canSetData

Determines if character data can be set.

##### Parameters

arg of type DOMString

Argument to be set.

##### Return Value

unsigned short A validation state [p.12] constant.

### No Exceptions

#### isWhitespaceOnly

Determines if character data is only whitespace.

##### Return Value

unsigned short A validation state [p.12] constant.

### No Parameters

### No Exceptions

### 1.3 Document Editing Interfaces

## Appendix A: Validation Outcomes

*Editor:*

Ben Chang, Oracle

### A.1 The `nodeValidity` and `validateDocument` methods

The following table describes all possible validation outcomes of the `NodeEditVAL.nodeValidity(valType)` [p.14] method.

Validation Type	Validity outcome		
	VAL_TRUE	VAL_FALSE	VAL_UNKNOWN
VAL_WF	The node is well-formed.	The node is not well-formed.	Not applicable.
VAL_NS_WF	The node is well-formed. Processor must take into account all the in-scope namespace declarations.	The node is not namespace well-formed. Processor must take into account all the in-scope namespace declarations.	Not applicable.
VAL_NS_WF	The node is well-formed. Processor must take into account all namespace declarations in scope.	The node is not namespace well-formed. Processor must take into account all the in-scope namespace declarations.	Not applicable.
VAL_SCHEMA	The node is valid: it complies with all the constraints expressed in the schema.	The node fails to comply to all the constraints expressed in the schema.	If the schema is an XML Schema, PSVI <b>[validity]</b> property value is unknown.
VAL_INCOMPLETE	The node is valid: it complies with the VAL_INCOMPLETE definition.	The node is invalid with regard to the VAL_INCOMPLETE definition.	If the schema is an XML Schema, PSVI <b>[validity]</b> property value is unknown.

The following table describes the outcome of the `DocumentEditVAL.validateDocument()` [p.11] and `NodeEditVAL.nodeValidity(valType)` [p.14] methods, with the latter called on the `DocumentEditVAL` [p.10] node with validationType `NodeEditVAL.VAL_SCHEMA` [p.12] .

Methods	Validity outcome		
	VAL_TRUE	VAL_FALSE	VAL_UNKNOWN
validateDocument and nodeValidity, called on the Document node with validationType VAL_SCHEMA.	If the schema is a DTD, then the document valid constraint is satisfied. If the schema is an XML Schema, then the document validity is the same as the validity of the validation root, i.e., documentElement: PSVI [validity] valid.	Fails to satisfy the constraints defined.	If the schema is an XML Schema, then schema is not found or the declaration for the validation root is not found: PSVI [validity] unknown.

The following table describes outcomes for the NodeEditVAL.nodeValidity(valType) [p.14] method called with the validationType NodeEditVAL.VAL\_SCHEMA [p.12] :

Node types	Validity outcome		
	VAL_TRUE	VAL_FALSE	VAL_UNKNOWN
Element	If the schema is a DTD, then element and attribute validity constraints, including attribute validity constraint defined below are satisfied. If the schema is an XML Schema, then PSVI [validity] valid.	Fails to satisfy the constraints defined.	If the schema is an XML Schema, then PSVI [validity] unknown.
Attr	If the schema is a DTD, then all validity constraints defined in section 3.3.1, "Attribute Type", required and fixed attribute are satisfied. If the schema is an XML Schema, then PSVI [validity] valid.	Fails to satisfy the constraints defined.	If the schema is an XML Schema, then PSVI [validity] unknown.
Text	The node is well-formed.	The node is not well-formed.	If no parent node is found.
CDATASection	The node is well-formed.	The node is not well-formed.	If no parent node is found.
ProcessingInstruction	The node is well-formed.	The node is not well-formed.	If no parent node is found.
Comment	The node is well-formed.	The node is not well-formed.	If no parent node is found.
EntityReference	Entity is declared.	Entity is not declared.	Not applicable.
Entity	Implementation-specific.	Implementation-specific.	Implementation-specific.
Notation	Implementation-specific.	Implementation-specific.	Implementation-specific.
DocumentType	Implementation-specific.	Implementation-specific.	Implementation-specific.
DocumentFragment	Not applicable.	Not applicable.	Not applicable.

## A.2 Other validation operations

The table below describes validation outcomes from `can*` validation operations, such as `NodeEditVAL.canRemoveChild()` [p.13], or `ElementEditVAL.canSetAttributeNS` [p.18], `CharacterDataEditVAL.canAppendData()` [p.20]. All these operations attempt to validate with validityType `NodeEditVAL.VAL_INCOMPLETE` [p.12].

<b>VAL_TRUE</b>	<b>VAL_FALSE</b>	<b>VAL_UNKNOWN</b>
If the associated operation is performed, then the node would be valid with regards to the <code>VAL_INCOMPLETE</code> definition or if there is no schema found.	If the associated operation is performed, then the node would be invalid with regards to the <code>VAL_INCOMPLETE</code> definition.	Not applicable.

Note: If the document includes more than one type of schema [p.41], e.g., DTD and XML Schema, and the `DOMConfiguration` "*schema-type*" parameter is not specified, the validation outcome for `NodeEditVAL.VAL_INCOMPLETE` [p.12] and `NodeEditVAL.VAL_SCHEMA` [p.12] is implementation-specific.

## Appendix B: IDL Definitions

This appendix contains the complete OMG IDL [OMG IDL] for the Level 3 Document Object Model Validation definitions.

The IDL files are also available as: <http://www.w3.org/TR/2003/PR-DOM-Level-3-Val-20031215/idl.zip>

### validation.idl:

```
// File: validation.idl

#ifndef _VALIDATION_IDL_
#define _VALIDATION_IDL_

#include "dom.idl"

#pragma prefix "dom.w3c.org"
module validation
{

    typedef dom::DOMString DOMString;
    typedef dom::DOMStringList DOMStringList;

## Appendix C: Java Language Binding

This appendix contains the complete Java [Java] bindings for the Level 3 Document Object Model Validation.

The Java files are also available as

<http://www.w3.org/TR/2003/PR-DOM-Level-3-Val-20031215/java-binding.zip>

### **org/w3c/dom/validation/ExceptionVAL.java:**

```
package org.w3c.dom.validation;

public class ExceptionVAL extends RuntimeException {
    public ExceptionVAL(short code, String message) {
        super(message);
        this.code = code;
    }
    public short    code;
    // ExceptionVALCode
    public static final short NO_SCHEMA_AVAILABLE_ERR    = 71;
}

```

### **org/w3c/dom/validation/DocumentEditVAL.java:**

```
package org.w3c.dom.validation;

import org.w3c.dom.DOMConfiguration;
import org.w3c.dom.DOMException;
import org.w3c.dom.NameList;

public interface DocumentEditVAL extends NodeEditVAL {
    public boolean getContinuousValidityChecking();
    public void setContinuousValidityChecking(boolean continuousValidityChecking)
    throws DOMException, ExceptionVAL, DOMException;

    public DOMConfiguration getDomConfig();

    public NameList getDefinedElements(String namespaceURI);

    public short validateDocument();
}

```

### **org/w3c/dom/validation/NodeEditVAL.java:**

```
package org.w3c.dom.validation;

import org.w3c.dom.Node;
import org.w3c.dom.DOMStringList;

public interface NodeEditVAL {
    // validationType
}

```

org/w3c/dom/validation/ElementEditVAL.java:

```
public static final short VAL_WF                = 1;
public static final short VAL_NS_WF            = 2;
public static final short VAL_INCOMPLETE       = 3;
public static final short VAL_SCHEMA           = 4;

// validationState
public static final short VAL_TRUE             = 5;
public static final short VAL_FALSE            = 6;
public static final short VAL_UNKNOWN          = 7;

public String getDefaultValue();

public DOMStringList getEnumeratedValues();

public short canInsertBefore(Node newChild,
                             Node refChild);

public short canRemoveChild(Node oldChild);

public short canReplaceChild(Node newChild,
                              Node oldChild);

public short canAppendChild(Node newChild);

public short nodeValidity(short valType);
}
```

## org/w3c/dom/validation/ElementEditVAL.java:

```
package org.w3c.dom.validation;

import org.w3c.dom.Node;
import org.w3c.dom.Attr;
import org.w3c.dom.NameList;

public interface ElementEditVAL extends NodeEditVAL {
    // ContentTypeVAL
    public static final short VAL_EMPTY_CONTENTTYPE    = 1;
    public static final short VAL_ANY_CONTENTTYPE      = 2;
    public static final short VAL_MIXED_CONTENTTYPE    = 3;
    public static final short VAL_ELEMENTS_CONTENTTYPE = 4;
    public static final short VAL_SIMPLE_CONTENTTYPE   = 5;

    public NameList getAllowedChildren();

    public NameList getAllowedFirstChildren();

    public NameList getAllowedParents();

    public NameList getAllowedNextSiblings();

    public NameList getAllowedPreviousSiblings();

    public NameList getAllowedAttributes();
}
```

org/w3c/dom/validation/CharacterDataEditVAL.java:

```
public NameList getRequiredAttributes();

public short getContentType();

public short canSetTextContent(String possibleTextContent);

public short canSetAttribute(String attrname,
                              String attrval);

public short canSetAttributeNode(Attr attrNode);

public short canSetAttributeNS(String namespaceURI,
                               String qualifiedName,
                               String value);

public short canRemoveAttribute(String attrname);

public short canRemoveAttributeNS(String namespaceURI,
                                  String localName);

public short canRemoveAttributeNode(Node attrNode);

public short isElementDefined(String name);

public short isElementDefinedNS(String namespaceURI,
                                String name);

}
```

## **org/w3c/dom/validation/CharacterDataEditVAL.java:**

```
package org.w3c.dom.validation;

import org.w3c.dom.DOMException;

public interface CharacterDataEditVAL extends NodeEditVAL {
    public short isWhitespaceOnly();

    public short canSetData(String arg);

    public short canAppendData(String arg);

    public short canReplaceData(int offset,
                                int count,
                                String arg)
        throws DOMException;

    public short canInsertData(int offset,
                               String arg)
        throws DOMException;

    public short canDeleteData(int offset,
                               int count)
        throws DOMException;

}
```

org/w3c/dom/validation/CharacterDataEditVAL.java:

## Appendix D: ECMAScript Language Binding

This appendix contains the complete ECMAScript [ECMAScript] binding for the Level 3 Document Object Model Validation definitions.

Properties of the **ExceptionVAL** Constructor function:

**ExceptionVAL.NO\_SCHEMA\_AVAILABLE\_ERR**

The value of the constant **ExceptionVAL.NO\_SCHEMA\_AVAILABLE\_ERR** is **71**.

Objects that implement the **ExceptionVAL** interface:

Properties of objects that implement the **ExceptionVAL** interface:

**code**

This property is a **Number**.

Objects that implement the **DocumentEditVAL** interface:

Objects that implement the **DocumentEditVAL** interface have all properties and functions of the **NodeEditVAL** interface as well as the properties and functions defined below.

Properties of objects that implement the **DocumentEditVAL** interface:

**continuousValidityChecking**

This property is a **Boolean** and can raise an object that implements the **DOMException** interface or the **ExceptionVAL** interface or the **DOMException** interface on setting.

**domConfig**

This read-only property is an object that implements the **DOMConfiguration** interface.

Functions of objects that implement the **DocumentEditVAL** interface:

**getDefinedElements(namespaceURI)**

This function returns an object that implements the **NameList** interface.

The **namespaceURI** parameter is a **String**.

**validateDocument()**

This function returns a **Number**.

Properties of the **NodeEditVAL** Constructor function:

**NodeEditVAL.VAL\_WF**

The value of the constant **NodeEditVAL.VAL\_WF** is **1**.

**NodeEditVAL.VAL\_NS\_WF**

The value of the constant **NodeEditVAL.VAL\_NS\_WF** is **2**.

**NodeEditVAL.VAL\_INCOMPLETE**

The value of the constant **NodeEditVAL.VAL\_INCOMPLETE** is **3**.

**NodeEditVAL.VAL\_SCHEMA**

The value of the constant **NodeEditVAL.VAL\_SCHEMA** is **4**.

**NodeEditVAL.VAL\_TRUE**

The value of the constant **NodeEditVAL.VAL\_TRUE** is **5**.

**NodeEditVAL.VAL\_FALSE**

The value of the constant **NodeEditVAL.VAL\_FALSE** is **6**.

**NodeEditVAL.VAL\_UNKNOWN**

The value of the constant **NodeEditVAL.VAL\_UNKNOWN** is **7**.

Objects that implement the **NodeEditVAL** interface:

Properties of objects that implement the **NodeEditVAL** interface:

**defaultValue**

This read-only property is a **String**.

**enumeratedValues**

This read-only property is an object that implements the **DOMStringList** interface.

Functions of objects that implement the **NodeEditVAL** interface:

**canInsertBefore(newChild, refChild)**

This function returns a **Number**.

The **newChild** parameter is an object that implements the **Node** interface.

The **refChild** parameter is an object that implements the **Node** interface.

**canRemoveChild(oldChild)**

This function returns a **Number**.

The **oldChild** parameter is an object that implements the **Node** interface.

**canReplaceChild(newChild, oldChild)**

This function returns a **Number**.

The **newChild** parameter is an object that implements the **Node** interface.

The **oldChild** parameter is an object that implements the **Node** interface.

**canAppendChild(newChild)**

This function returns a **Number**.

The **newChild** parameter is an object that implements the **Node** interface.

**nodeValidity(valType)**

This function returns a **Number**.

The **valType** parameter is a **Number**.

Properties of the **ElementEditVAL** Constructor function:

**ElementEditVAL.VAL\_EMPTY\_CONTENTTYPE**

The value of the constant **ElementEditVAL.VAL\_EMPTY\_CONTENTTYPE** is **1**.

**ElementEditVAL.VAL\_ANY\_CONTENTTYPE**

The value of the constant **ElementEditVAL.VAL\_ANY\_CONTENTTYPE** is **2**.

**ElementEditVAL.VAL\_MIXED\_CONTENTTYPE**

The value of the constant **ElementEditVAL.VAL\_MIXED\_CONTENTTYPE** is **3**.

**ElementEditVAL.VAL\_ELEMENTS\_CONTENTTYPE**

The value of the constant **ElementEditVAL.VAL\_ELEMENTS\_CONTENTTYPE** is **4**.

**ElementEditVAL.VAL\_SIMPLE\_CONTENTTYPE**

The value of the constant **ElementEditVAL.VAL\_SIMPLE\_CONTENTTYPE** is **5**.

Objects that implement the **ElementEditVAL** interface:

Objects that implement the **ElementEditVAL** interface have all properties and functions of the **NodeEditVAL** interface as well as the properties and functions defined below.

Properties of objects that implement the **ElementEditVAL** interface:

**allowedChildren**

This read-only property is an object that implements the **NameList** interface.

**allowedFirstChildren**

This read-only property is an object that implements the **NameList** interface.

**allowedParents**

This read-only property is an object that implements the **NameList** interface.

**allowedNextSiblings**

This read-only property is an object that implements the **NameList** interface.

**allowedPreviousSiblings**

This read-only property is an object that implements the **NameList** interface.

**allowedAttributes**

This read-only property is an object that implements the **NameList** interface.

**requiredAttributes**

This read-only property is an object that implements the **NameList** interface.

**contentType**

This read-only property is a **Number**.

Functions of objects that implement the **ElementEditVAL** interface:

**canSetTextContent(possibleTextContent)**

This function returns a **Number**.

The **possibleTextContent** parameter is a **String**.

**canSetAttribute(attrname, attrval)**

This function returns a **Number**.

The **attrname** parameter is a **String**.

The **attrval** parameter is a **String**.

**canSetAttributeNode(attrNode)**

This function returns a **Number**.

The **attrNode** parameter is an object that implements the **Attr** interface.

**canSetAttributeNS(namespaceURI, qualifiedName, value)**

This function returns a **Number**.

The **namespaceURI** parameter is a **String**.

The **qualifiedName** parameter is a **String**.

The **value** parameter is a **String**.

**canRemoveAttribute(attrname)**

This function returns a **Number**.

The **attrname** parameter is a **String**.

**canRemoveAttributeNS(namespaceURI, localName)**

This function returns a **Number**.

The **namespaceURI** parameter is a **String**.

The **localName** parameter is a **String**.

**canRemoveAttributeNode(attrNode)**

This function returns a **Number**.

The **attrNode** parameter is an object that implements the **Node** interface.

**isElementDefined(name)**

This function returns a **Number**.

The **name** parameter is a **String**.

**isElementDefinedNS(namespaceURI, name)**

This function returns a **Number**.

The **namespaceURI** parameter is a **String**.

The **name** parameter is a **String**.

Objects that implement the **CharacterDataEditVAL** interface:

Objects that implement the **CharacterDataEditVAL** interface have all properties and functions of the **NodeEditVAL** interface as well as the properties and functions defined below.

Functions of objects that implement the **CharacterDataEditVAL** interface:

**isWhitespaceOnly()**

This function returns a **Number**.

**canSetData(arg)**

This function returns a **Number**.

The **arg** parameter is a **String**.

**canAppendData(arg)**

This function returns a **Number**.

The **arg** parameter is a **String**.

**canReplaceData(offset, count, arg)**

This function returns a **Number**.

The **offset** parameter is a **Number**.

The **count** parameter is a **Number**.

The **arg** parameter is a **String**.

This function can raise an object that implements the **DOMException** interface.

**canInsertData(offset, arg)**

This function returns a **Number**.

The **offset** parameter is a **Number**.

The **arg** parameter is a **String**.

This function can raise an object that implements the **DOMException** interface.

**canDeleteData(offset, count)**

This function returns a **Number**.

The **offset** parameter is a **Number**.

The **count** parameter is a **Number**.

This function can raise an object that implements the **DOMException** interface.

## Appendix E: Acknowledgements

Many people contributed to the DOM specifications (Level 1, 2 or 3), including participants of the DOM Working Group and the DOM Interest Group. We especially thank the following:

Andrew Watson (Object Management Group), Andy Heninger (IBM), Angel Diaz (IBM), Arnaud Le Hors (W3C and IBM), Ashok Malhotra (IBM and Microsoft), Ben Chang (Oracle), Bill Smith (Sun), Bill Shea (Merrill Lynch), Bob Sutor (IBM), Chris Lovett (Microsoft), Chris Wilson (Microsoft), David Brownell (Sun), David Ezell (Hewlett-Packard Company), David Singer (IBM), Dimitris Dimitriadis (Improve AB and invited expert), Don Park (invited), Elena Litani (IBM), Eric Vasilik (Microsoft), Gavin Nicol (INSO), Ian Jacobs (W3C), James Clark (invited), James Davidson (Sun), Jared Sorensen (Novell), Jeroen van Rotterdam (X-Hive Corporation), Joe Kesselman (IBM), Joe Lapp (webMethods), Joe Marini (Macromedia), Johnny Stenback (Netscape/AOL), Jon Ferraiolo (Adobe), Jonathan Marsh (Microsoft), Jonathan Robie (Texcel Research and Software AG), Kim Adamson-Sharpe (SoftQuad Software Inc.), Lauren Wood (SoftQuad Software Inc., *former Chair*), Laurence Cable (Sun), Mark Davis (IBM), Mark Scardina (Oracle), Martin Dürst (W3C), Mary Brady (NIST), Mick Goulsh (Software AG), Mike Champion (Arbortext and Software AG), Miles Sabin (Cromwell Media), Patti Lutsky (Arbortext), Paul Grosso (Arbortext), Peter Sharpe (SoftQuad Software Inc.), Phil Karlton (Netscape), Philippe Le Hégarret (W3C, *W3C Team Contact and former Chair*), Ramesh Lekshmyrayanan (Merrill Lynch), Ray Whitmer (iMall, Excite@Home, and Netscape/AOL, *Chair*), Rezaur Rahman (Intel), Rich Rollman (Microsoft), Rick Gessner (Netscape), Rick Jelliffe (invited), Rob Relyea (Microsoft), Scott Isaacs (Microsoft), Sharon Adler (INSO), Steve Byrne (JavaSoft), Tim Bray (invited), Tim Yu (Oracle), Tom Pixley (Netscape/AOL), Vidur Apparao (Netscape), Vinod Anupam (Lucent).

Thanks to all those who have helped to improve this specification by sending suggestions and corrections (Please, keep bugging us with your issues!).

Special thanks to the DOM Conformance Test Suites contributors: Curt Arnold, Fred Drake, Mary Brady (NIST), Rick Rivello (NIST), Robert Clary (Netscape).

### E.1 Production Systems

This specification was written in XML. The HTML, OMG IDL, Java and ECMAScript bindings were all produced automatically.

Thanks to Joe English, author of cost, which was used as the basis for producing DOM Level 1. Thanks also to Gavin Nicol, who wrote the scripts which run on top of cost. Arnaud Le Hors and Philippe Le Hégarret maintained the scripts.

After DOM Level 1, we used Xerces as the basis DOM implementation and wish to thank the authors. Philippe Le Hégarret and Arnaud Le Hors wrote the Java programs which are the DOM application.

Thanks also to Jan Kärman, author of html2ps, which we use in creating the PostScript version of the specification.

# Glossary

## *Editors:*

Arnaud Le Hors, W3C

Robert S. Sutor, IBM Research (for DOM Level 1)

Some of the following term definitions have been borrowed or modified from similar definitions in other W3C or standards documents. See the links within the definitions for more information.

### **global declaration**

A *global declaration* is a schema declaration, usually for an element or an attribute, that is available for use in content models throughout the schema [p.41] , i.e. a declaration that is not bound to a particular context.

### **namespace well-formed**

A node is a *namespace well-formed XML* node if it is a well-formed [p.41] node, and follows the productions and namespace constraints. If [XML 1.0] is used, the constraints are defined in [XML Namespaces]. If [XML 1.1] is used, the constraints are defined in [XML Namespaces 1.1].

### **schema**

A *schema* defines a set of structural and value constraints applicable to XML documents. Schemas can be expressed in schema languages, such as DTD, XML Schema, etc.

### **well-formed**

A node is a *well-formed XML* node if its serialized form, without doing any transformation during its serialization, matches its respective production in [XML 1.0] or [XML 1.1] (depending on the XML version in use) with all well-formedness constraints related to that production, and if the entities which are referenced within the node are also well-formed. If namespaces for XML are in use, the node must also be namespace well-formed [p.41] .
