What is XMP?

- **Technical description**

“Adobe’s Extensible Metadata Platform (XMP) is a labeling technology that allows you to embed data about a file, known as metadata, into the file itself.”

- **WWW Description**

“Adobe Systems Inc. has built into its products Adobe XMP (Extensible Metadata Platform), an RDF-based metadata system that links contextual information with content files.”

- Tim Berners-Lee, yesterday

Imagine if your files could talk...

- **You would know where they've been**
 - Store contact info and e-commerce links
- **Whether it's appropriate to use them**
 - License usages, copyright notification
- **They could tell you what happened to them**
 - I've been cropped, rasterized, dithered...
- **They could provide information on the contents**
 - Map coordinates, people names, places, events
- **Who their relatives and friends are**
 - I'm related to or derivative of another file
- **Where they are going**
 - What expected next in the workflow
- **XMP provides a common language for interchange**

What are the Challenges?

- **Capture**
 - Accuracy, consistency, ease of use
- **Compatibility**
 - Dropped or locked metadata
- **Overlapping Vocabularies**
 - Colliding properties from different standards (e.g., author, creator)
- **Extensibility**
 - Limited to specific domains (file formats, db, industries)
 - Cost of adding new properties & translation updates
- **Interoperability**
 - Preservation across diverse file formats, devices, applications, databases
 - Translating industry specific terminology

Who cares about Metadata?

- **Content creators & producers**
 - Efficiently reuse & repurpose content
 - Proper usage of media assets
- **Technology & design managers**
 - Interoperability with variety of vendors & systems
 - Works with legacy systems
 - Extensible for future developments
- **Content Syndicators**
 - Better ways to browse, search & retrieve media files
 - Tighter integration & improved consumption of assets
- **Developers & integrators**
 - Interoperability & extensibility to expand opportunities
 - Open flexibility - not locked into proprietary technology

How does XMP address these Challenges?

- **Neutrality**
 - File format independent
 - XMP 'packet' is stored in existing custom data locations for file formats
- **Speaking a common language**
 - Open standards based framework
 - Uses XML & subset of RDF
- **Building upon common vocabularies**
 - Schemas & properties from Dublin Core, IPTC, EXIF
- **Freely available 'language' resources**
 - Open source license SDK available for free
- **Open for discussion & dialog**
 - Creative Suite optimized to speak XMP
 - Partners & products joining in the discussion
- **User-friendly metadata collection and presentation**
 - Customized UI screens across products
