

Why a DDR?

MobileAware Ltd
Presentation to W3C MWI DDWG Workshop
Madrid, 2006

Rotan Hanrahan
Chief Innovations Architect
(Chair DDWG)

Accepted Wisdom

- Devices have diverse characteristics, especially mobile devices
 - MobileAware has evaluated well over 2000 devices
 - Each device has several hundred potentially useful characteristics
 - Many more devices are being evaluated, and more are coming
- Basic adaptation only requires a small subset of characteristics
 - To improve quality, take account of more characteristics
 - High quality adaptation is the focus of specialist solutions
- The mobile aspect of the Web will benefit from content adaptation
 - Basic techniques are freely available
 - Techniques use information about the client/device
- Getting device information for adaptation is a challenge
 - So many devices, so few sources of information
 - Available information is often incomplete
- If available, reliable access to information would stimulate the Web
 - In the best interest of "Mobile Web" to have this information
 - Even small contributions will be beneficial
 - A stimulated Mobile Web will be good for mobile market players

Challenges for Open Source

- Open Source is part of the solution to gathering device information
 - Volunteer activity
 - Ad-hoc contributions accepted (no barrier to growth)
 - Review/correction easy to facilitate
 - No limits to use
- BUT: Adoption in specialist solutions is low
 - Scope of information might not exactly match needs
 - No guarantees, no accountability, limited traceability
 - “Holes” in data can be hard to fill
 - No formal industry support (e.g. no direct input from manufacturers)
 - Integration into products not always an easy task
- Can OS efforts be supported in an industry standardised way?
 - Need a common and open framework
 - Permit industry and OS contributions
 - Have a “low barrier to entry”
 - Avoid complicated integration overheads
 - Keep things simple

Will UAProf solve the problem?

User Agent Profiles are an industry standard, but...

- No notifications 
 - Limited information 
 - Quality control 
 - Updates/corrections 
 - Not mandatory ... 
 - No fixed access point 
- UAProf Instance 1 
- UAProf Instance 2 
- UAProf Instance 3 

(Note: OMA know the issues and are addressing some of them.)

What about “home brew” ?

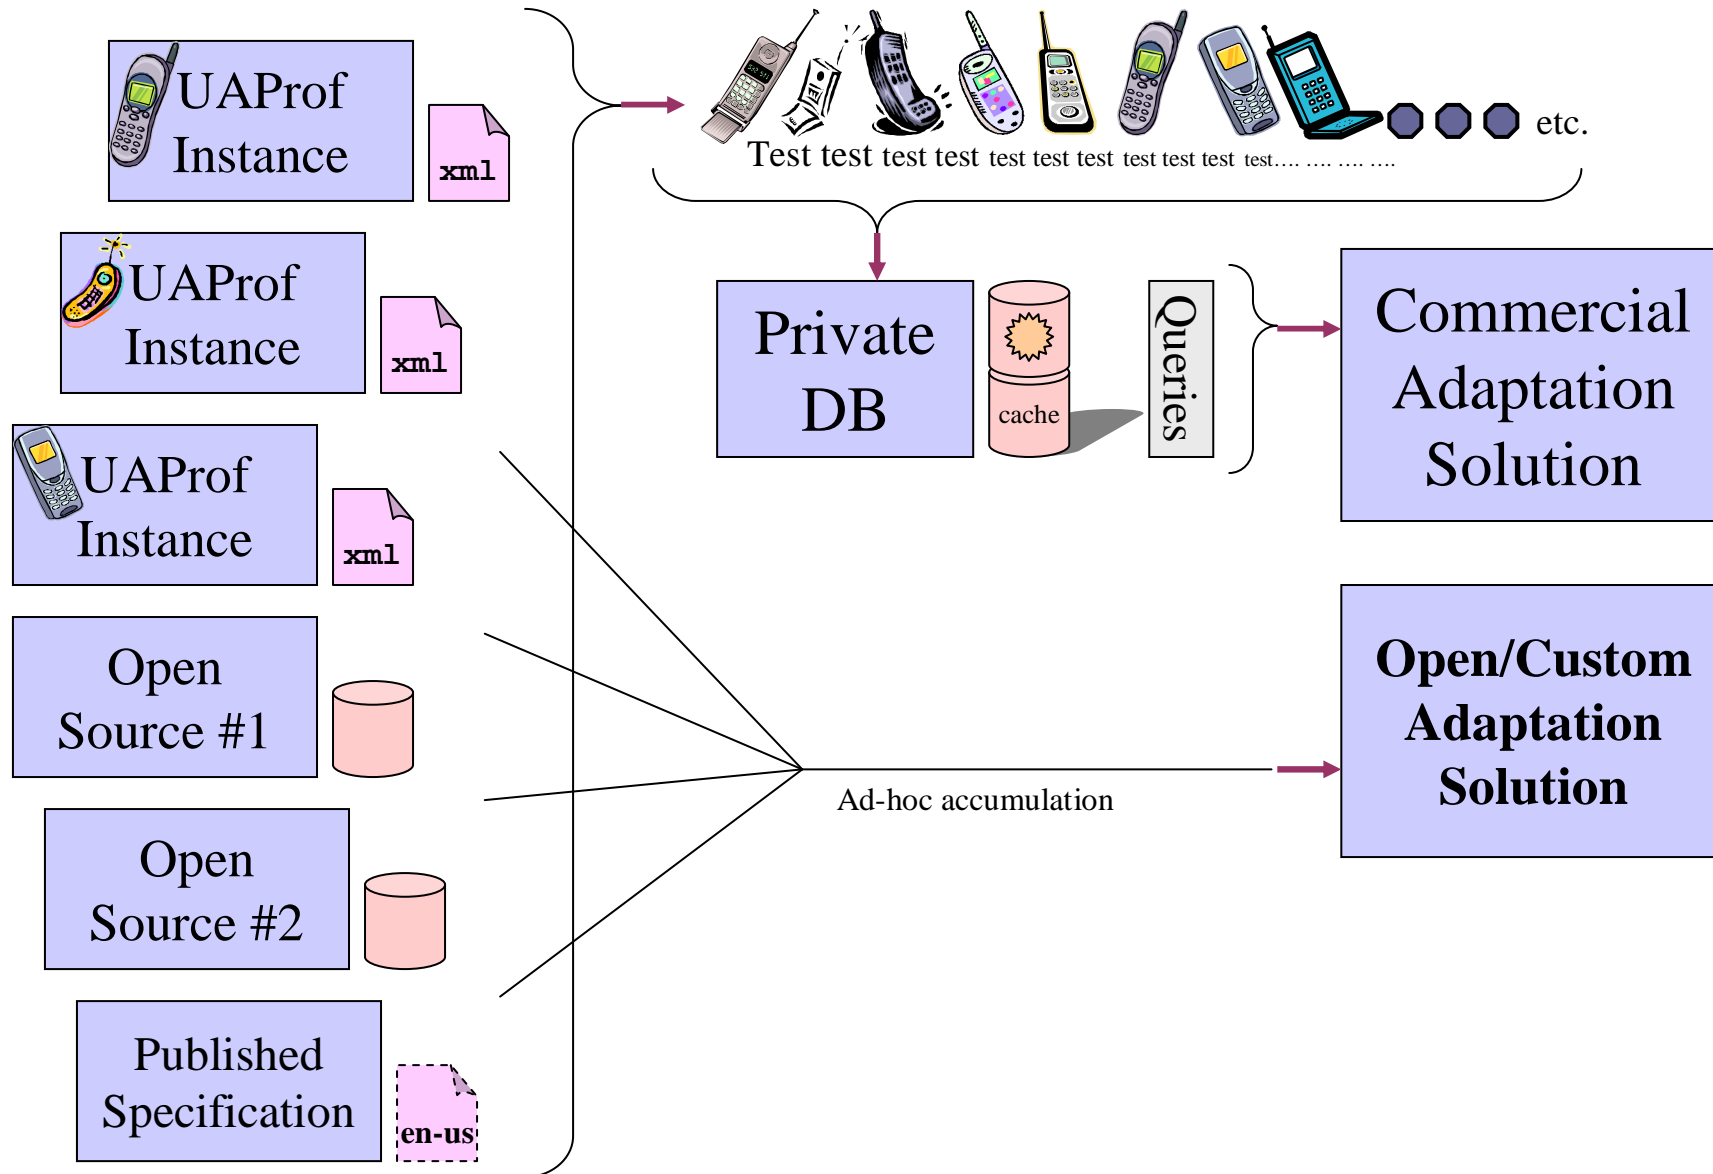

Proprietary device databases have their own problems...

- Unsustainable effort
- “Surprise” new devices
- Custom integration
- Viewed as non-standard
- Single purpose
- Require maintenance

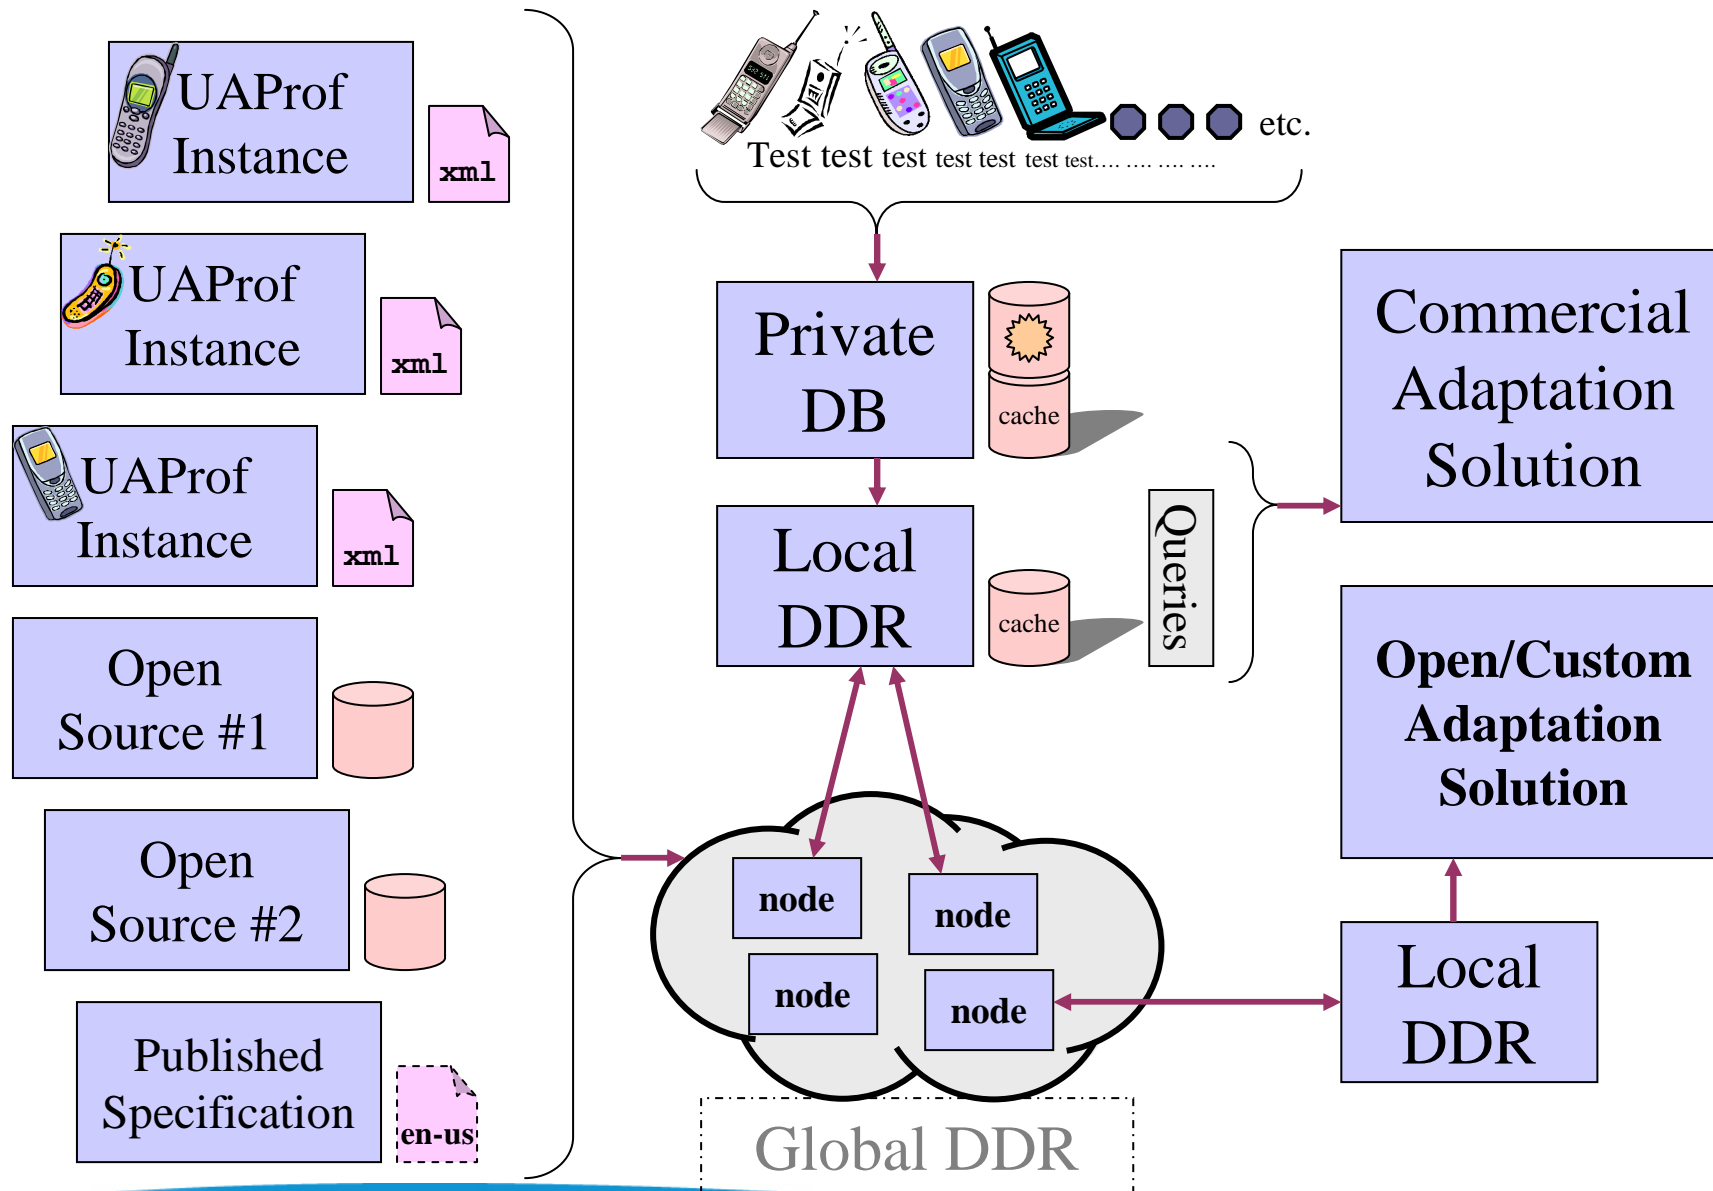

(Note: They work, but are only available at a cost.)

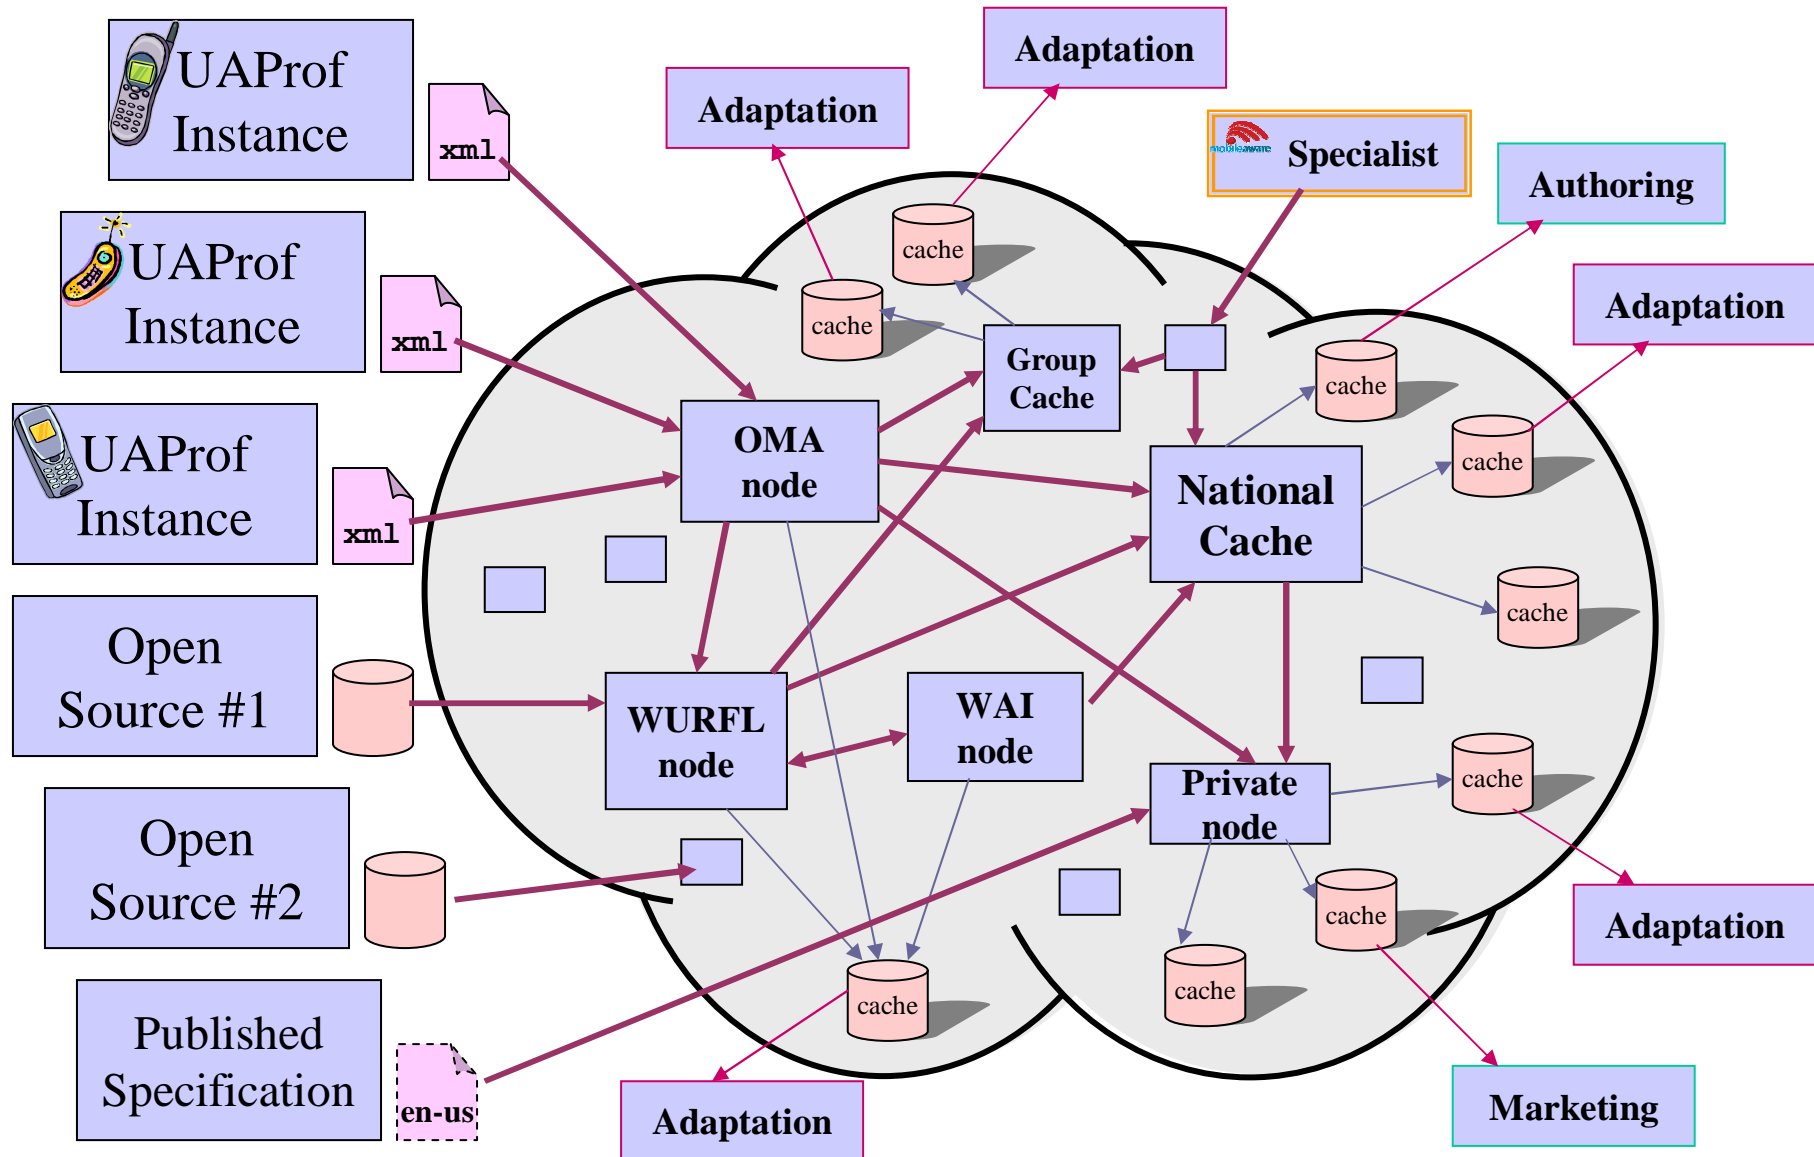

The way it is

The way it could be

DD Community

Why participate?

- Stimulate the Mobile Web
 - Provide common means of contributing device information
 - Adopt a common means of accessing device information
 - Attract more content/service providers into the mobile space
 - Increases demand for quality content/service solutions
- Reduce costs
 - Awareness of device characteristics will pervade the industry
 - Common interfaces reduce integration overheads
- New application opportunities
 - New markets for solutions that build upon device knowledge
- No threat
 - Custom information can still be retained within products
- Good Web citizenship
 - Tradition of contributing technology/expertise/knowledge
 - Adaptable Web is important for many communities
 - Developing countries and access-challenged

Conclusion

- MobileAware wants to work with like-minded Mobile Web people
- A DDR will generally increase content quality in the Mobile Web
- A DDR will lower the barrier to creating mobile content
- “Stimulated” Mobile Web will have increased demand for quality
- Increased demand for quality is good for our core business
 - (Rising tide, all boats etc...)
- Let’s implement!
