

The diversity of mobile handsets, operating systems and networks make developing and testing Ajax-based applications and content unwieldy, expensive and yet unreliable. At the same time, devices are often difficult for developers to obtain, and content validation requires manual (and thus error-prone) processes. DeviceAnywhere, a revolutionary service from Mobile Complete, provides developers real-time interaction with real devices connected to live global networks. Built on Mobile Complete's innovative device interaction technology, Direct-To-Device, DeviceAnywhere empowers users to connect to and interact with mobile devices located even thousands of miles away – over the Internet.

Developers using DeviceAnywhere no longer need to invest in device labs or even be physically present in the network, allowing companies to save billions on data testing. Expensive trips for testing their mobile content in remote networks become a none-issue with DeviceAnywhere because it provides immediate handset and network access to remote teams and offshore groups – allowing them to collaborate on projects. Every customer can leverage DeviceAnywhere to realize huge cost savings, to get their products to market faster, and to expand their market reach by addressing networks outside their geographical location.
