In our project, we investigate and develop an IPTV service. We developed a technology of the IPTV service using BML on NGN. And, we developed a retransmission technology of the terrestrial digital broadcasting in Japan. We have serviced using these technologies since 2008.

We have following two interests about the W3C Web on TV Workshop.

-What service and what function

We're interested in what services are done by a television and a non-PC device. And, we pay attention to what functions are standardized in the viewpoint of the application framework.

-Impacts on IPTV services.

We pay attention to impacts on IPTV Services by standardization of Web on TV. We expect also to discuss about secure services as well as cooperation with the Internet.
