

National Strategy for Trusted Identities in Cyberspace - Requirements and Potential Use Cases
By Peter Alterman (NIH)

The National Strategy for Trusted Identities in Cyberspace (NSTIC) envisions a cyber world - the Identity Ecosystem - that improves upon the passwords currently used to log-in online. It would include a vibrant marketplace that allows people to choose among multiple identity providers - both private and public - that would issue trusted credentials that prove identity. Our presentation will focus on the whats and hows.
