# Open Data Certificates Mythbusters

The rights and wrongs of Open Data Certificates

**'Open Data  
Certificates assess the  
quality of the data'**

~~'Open Data  
Certificate assess the  
quality of the data'~~

Certificates assess  
how good your  
**support** is for the  
use of your open  
data

Certificates treats open data like an **information product**.  
It looks beyond the technical aspects and assesses how a given  
dataset is managed holistically 'as-a-service' – legal, practical and  
social.

‘Open Data Certificate  
covers all the relevant  
standards for my open  
data’

The background of the slide is a photograph of an engineering drawing on a wooden surface. A red 'X' is drawn over the text on the left. In the top right corner, a small book titled 'Machinery's Handbook' is visible.

**'Open Data Certificate  
covers all the relevant  
standards for any open  
data'**

**Certificates DO  
NOT replace  
existing standards**

**Certificates are complimentary to existing standards, regulatory requirements and best-practice guidelines for publishing data (e.g. W3C, Open Data Handbook, TBL-5 star). Instead, certificates offers recognition for following best practice**

An aerial night photograph of the London 2012 Olympic Stadium. The stadium is illuminated with blue light projections. Large, pixelated letters spell out 'FOR EVERYONE' across the stadium's facade. In the foreground, a large, glowing blue structure resembling a house is visible. The stadium's roof structure, consisting of several tall, triangular towers, is also visible.

**‘Certificates are for UK  
datasets and are not  
useful for my datasets’**

**~~‘Certificates are for UK datasets and are not useful for my datasets’~~**

Certificates have been awarded in 36 countries and localised in 9 countries

Good practice applies to all – regardless of organisations, sectors or countries. The localisation programme specifically reviews the legal sections of the certificates so they stay relevant for each jurisdiction.

**‘We should aim for  
Expert certificates for  
ALL our open data’**

~~'We should aim for  
Expert certificates for  
ALL our open data'~~

It depends...  
Identify the 'value'  
of the dataset you  
are releasing first

Four sets of standards to benchmark against dependent on the 'value' of dataset; ranging from high-impact, high-value datasets to experimental datasets, make informed choice based on the ROI to open, publish and maintain the data.

**'It takes too much  
time to certify all my  
datasets'**

~~'It takes too much  
time to certify all my  
datasets~~

There is an option  
to automatically  
generate  
certificates...

Having robust metadata for the open data will make the certification  
simple – you can then generate the certificates automatically.

# Values

Who	Use cases
Data consumer	Find and assess suitability of open data
Policy lead	Set the bar and measure policy impact
Data portal / platform owner	Improve metadata quality Discoverability
Data owner	Recognition Creation of quick-reference sheet

# Data consumer

CHALLENGE: Find suitable open data quickly

- ✓ Certificate = Open
- ✓ Certificate acts as a quick-reference sheet for each dataset
- ✓ Links to data, publisher and documentation
- ✓ Country, sector, and technology neutral

# Policy lead

CHALLENGE: Setting a bar and measuring the impact

- ✓ Short-hand set of requirements to reference in policy docs
- ✓ Reference in contacts in procurement
- ✓ Framework for measuring quantity and quality

# Portal & platform owner

CHALLENGE: Quality of datasets published

- ✓ Reports from automatic certification help identify problem areas
- ✓ Provides a framework for data publishers
- ✓ Assess the quality landscape

# Data owner

CHALLENGE: What aspects of open data need improving?

- ✓ Interactive tool acting as a check-list
- ✓ Earn the badge for recognition and assurance
- ✓ Country, sector, and technology neutral
