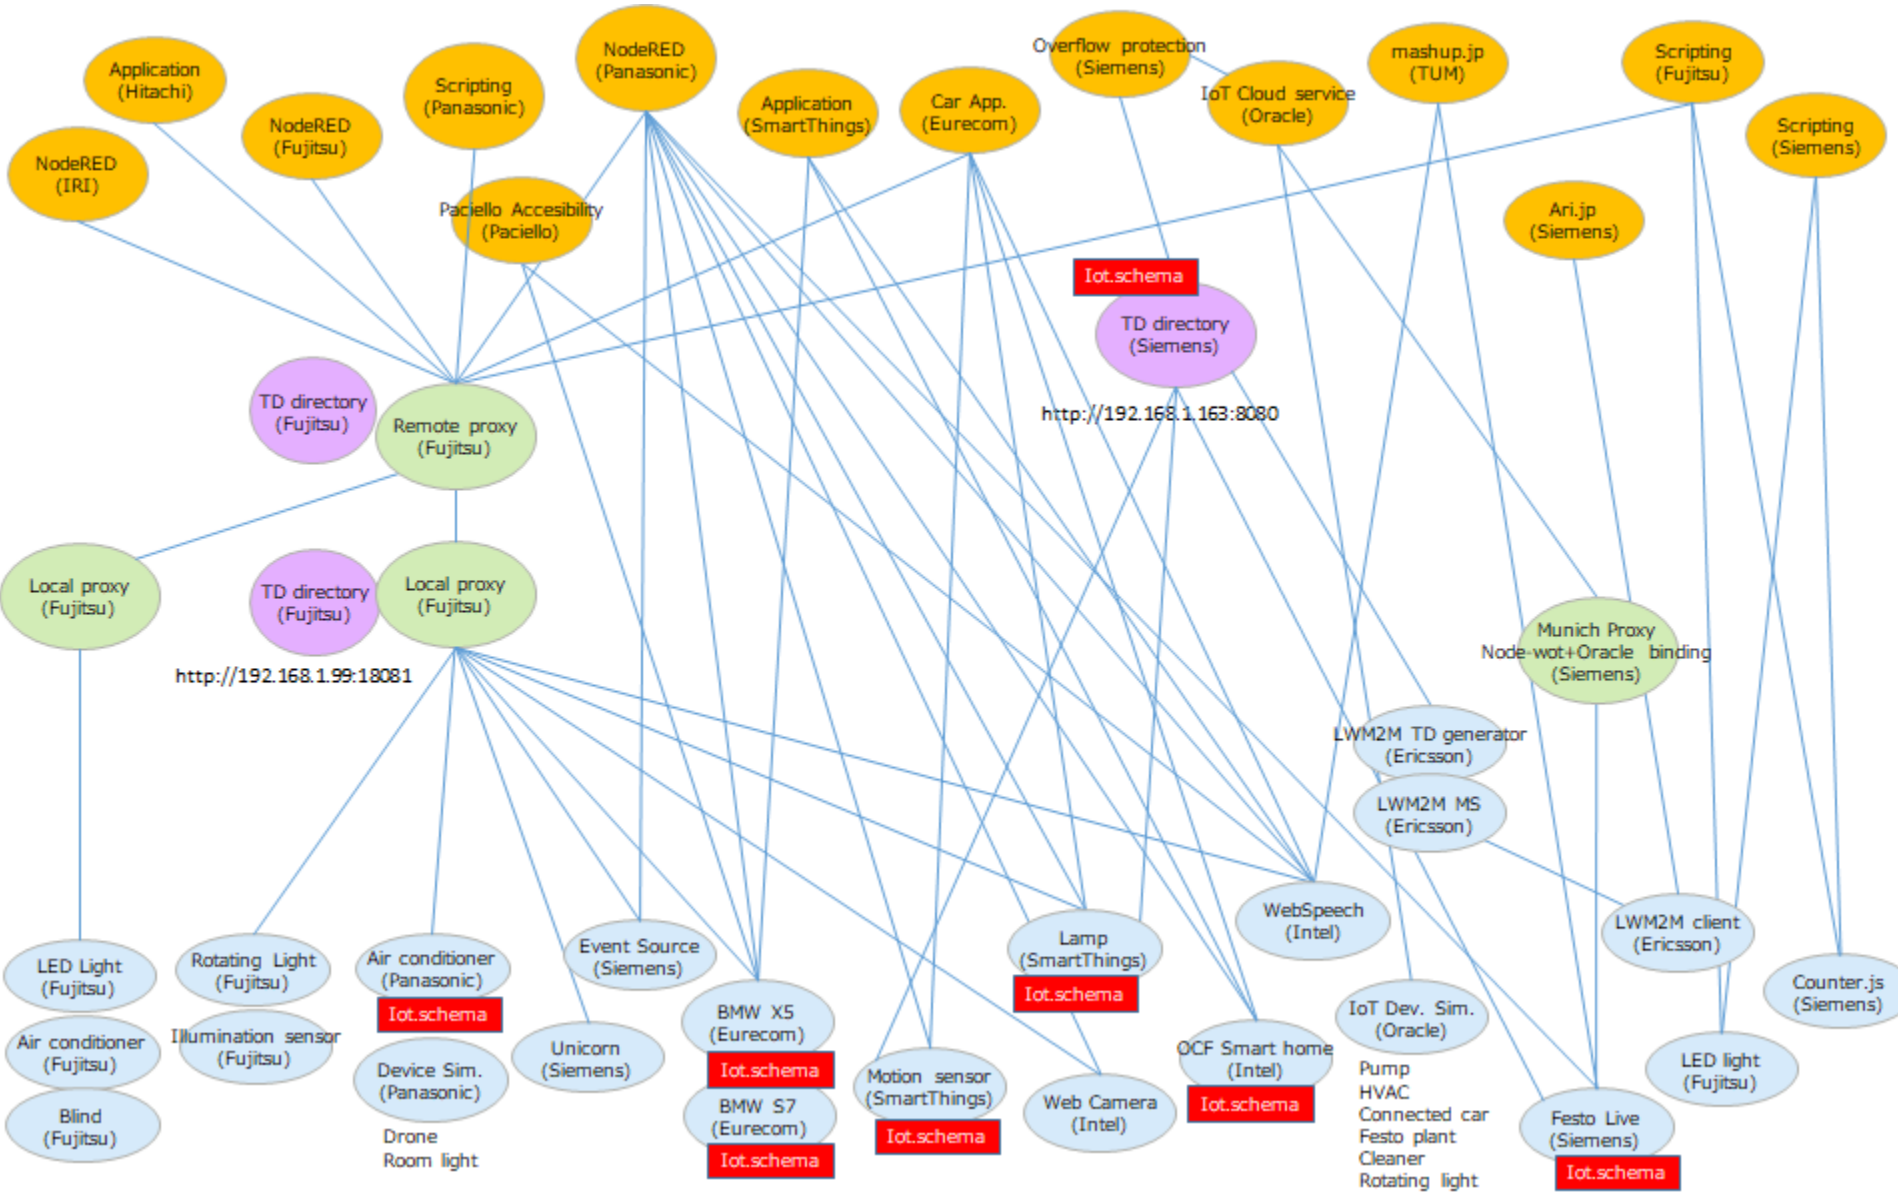
PlugFest diagrams and Architecture document

3 July, 2018

Ryuichi Matsukura
Fujitsu Laboratories Limited

Achievements of the previous PlugFest

FUJITSU



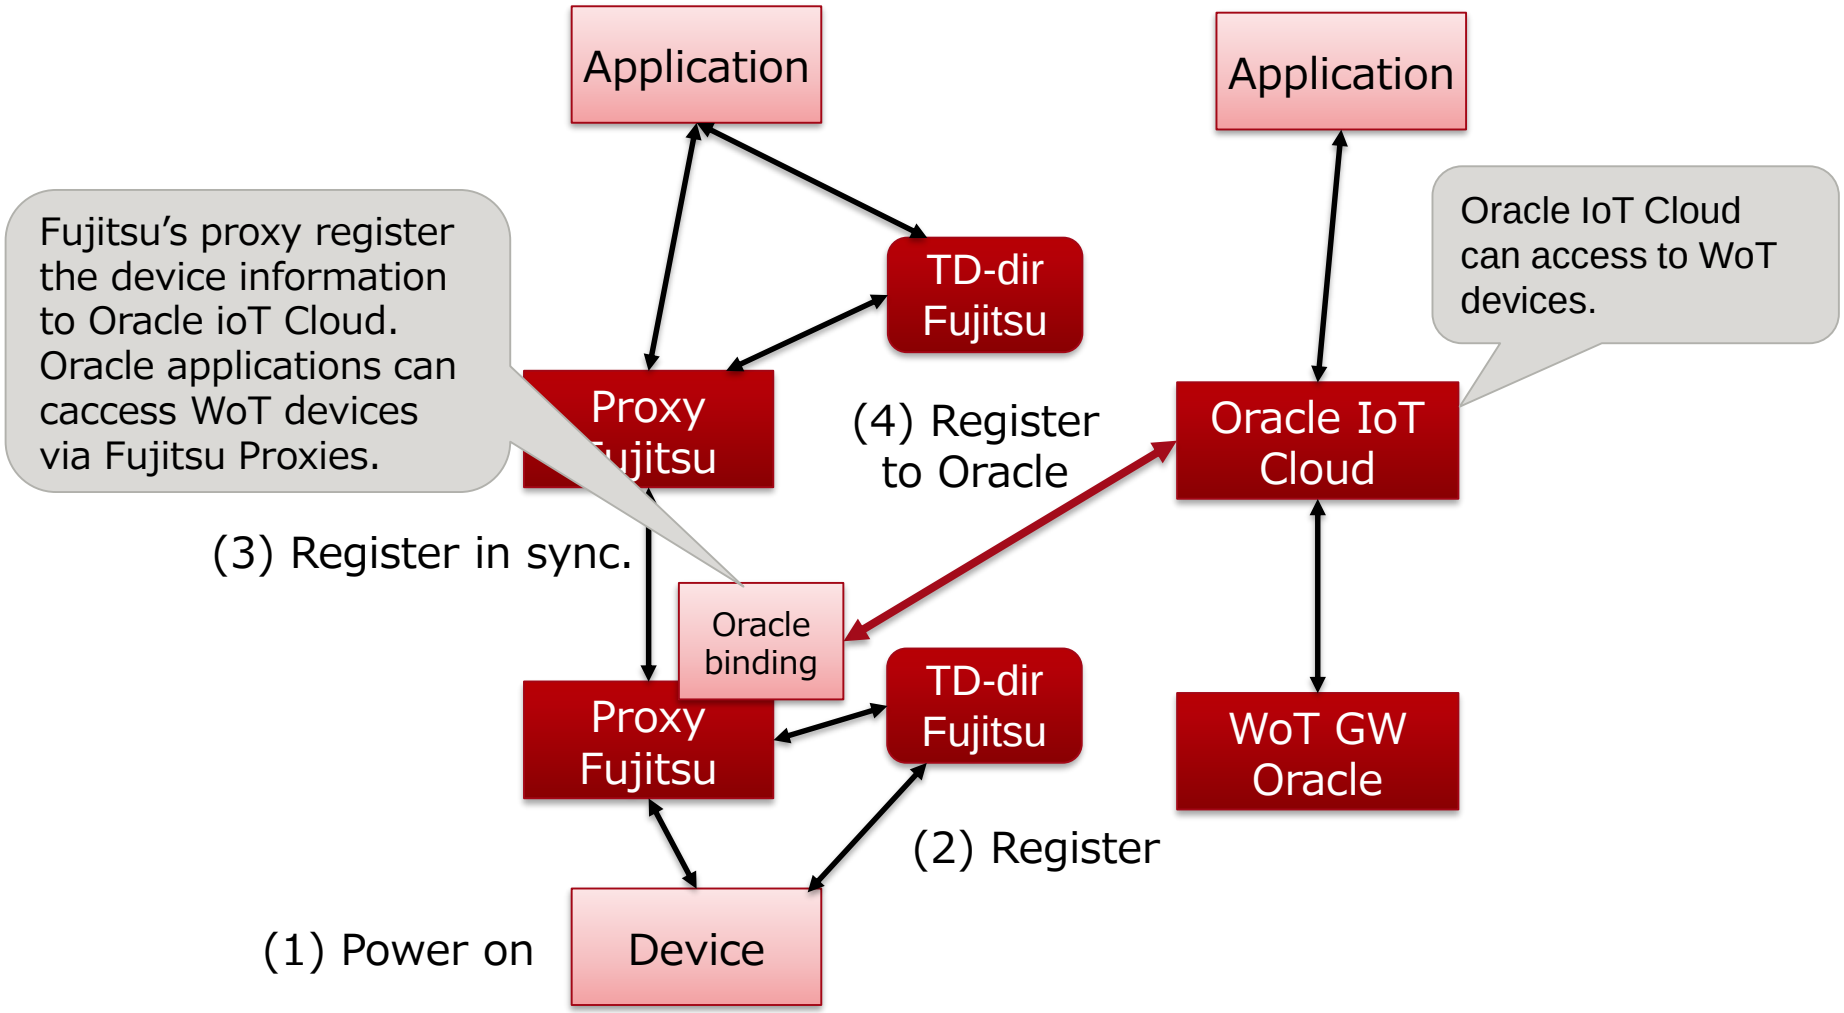
Checking points for Bundang PlugFest

FUJITSU

- **Multiple proxy interaction**
- **Application servients/Device servients**
- **Node-wot as a servient**
- **Scripting API implementation**
- **Thing Directory operation (multiple-directory integration)**
- **Device simulators**
- **Semantic integration (iotschema.org)**
- **Security (API keys, etc.)**
- **Accessibility**
- **Event handling**

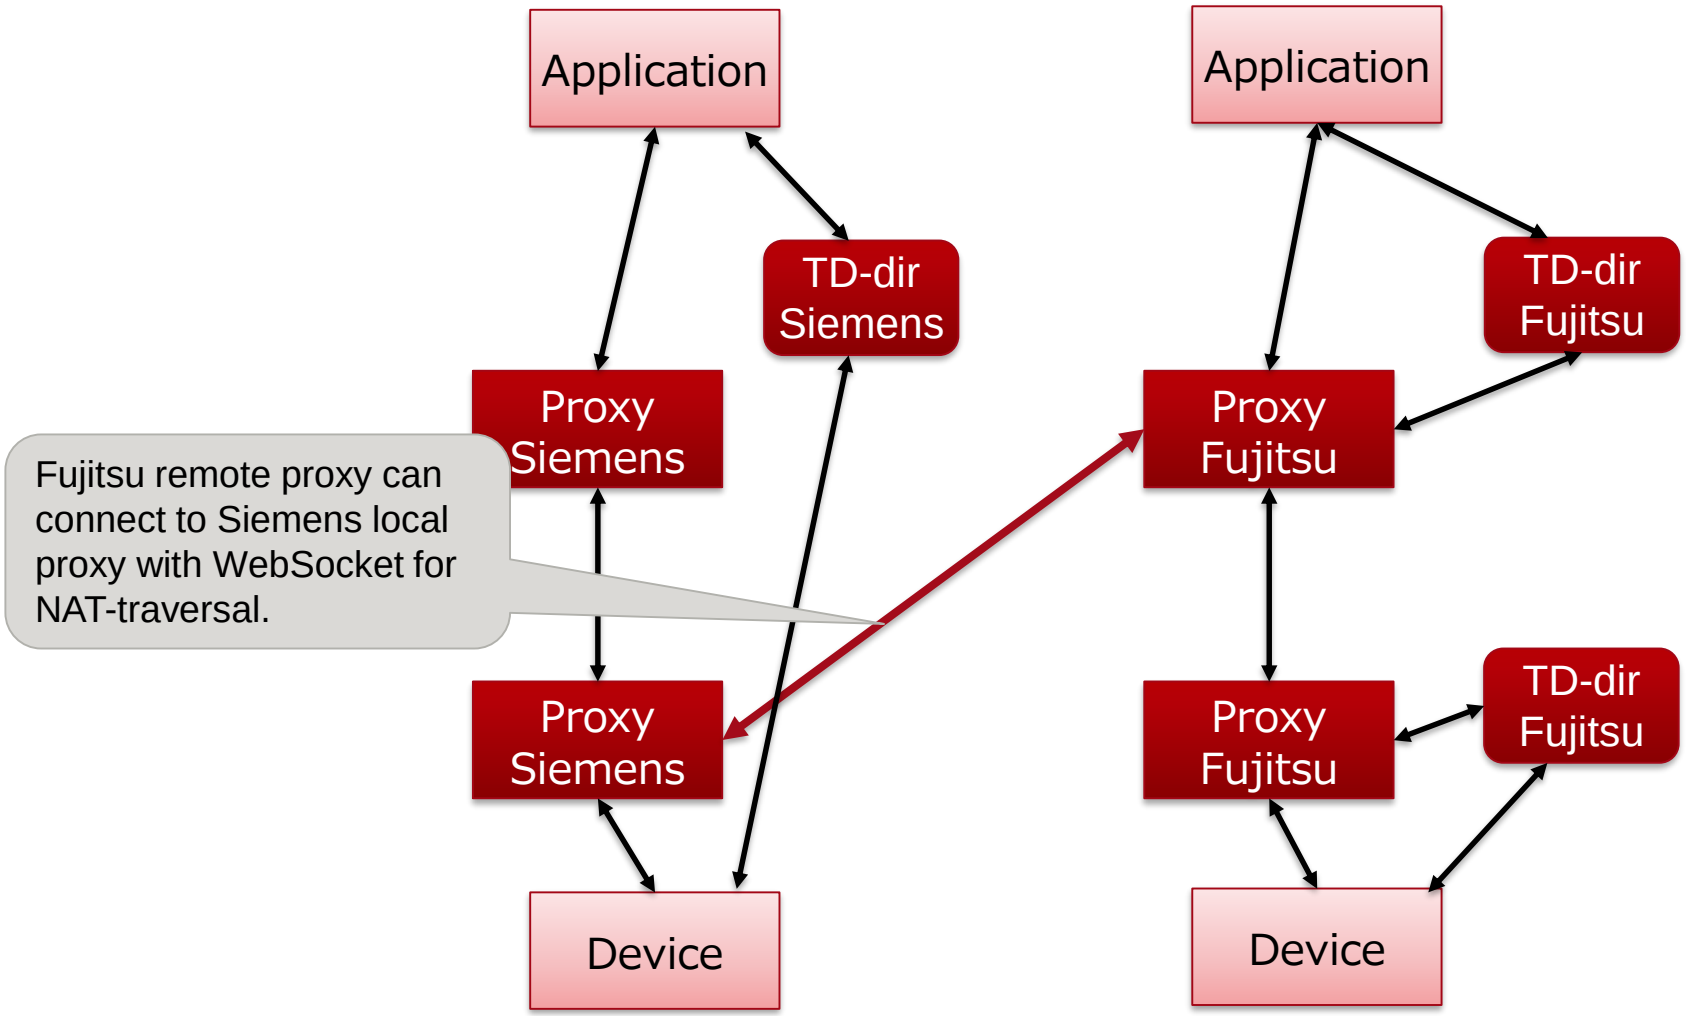
Connection with Oracle IoT Cloud

- Fujitsu proxy can connect with Oracle binding to transform Oracle IoT Cloud propriety interface



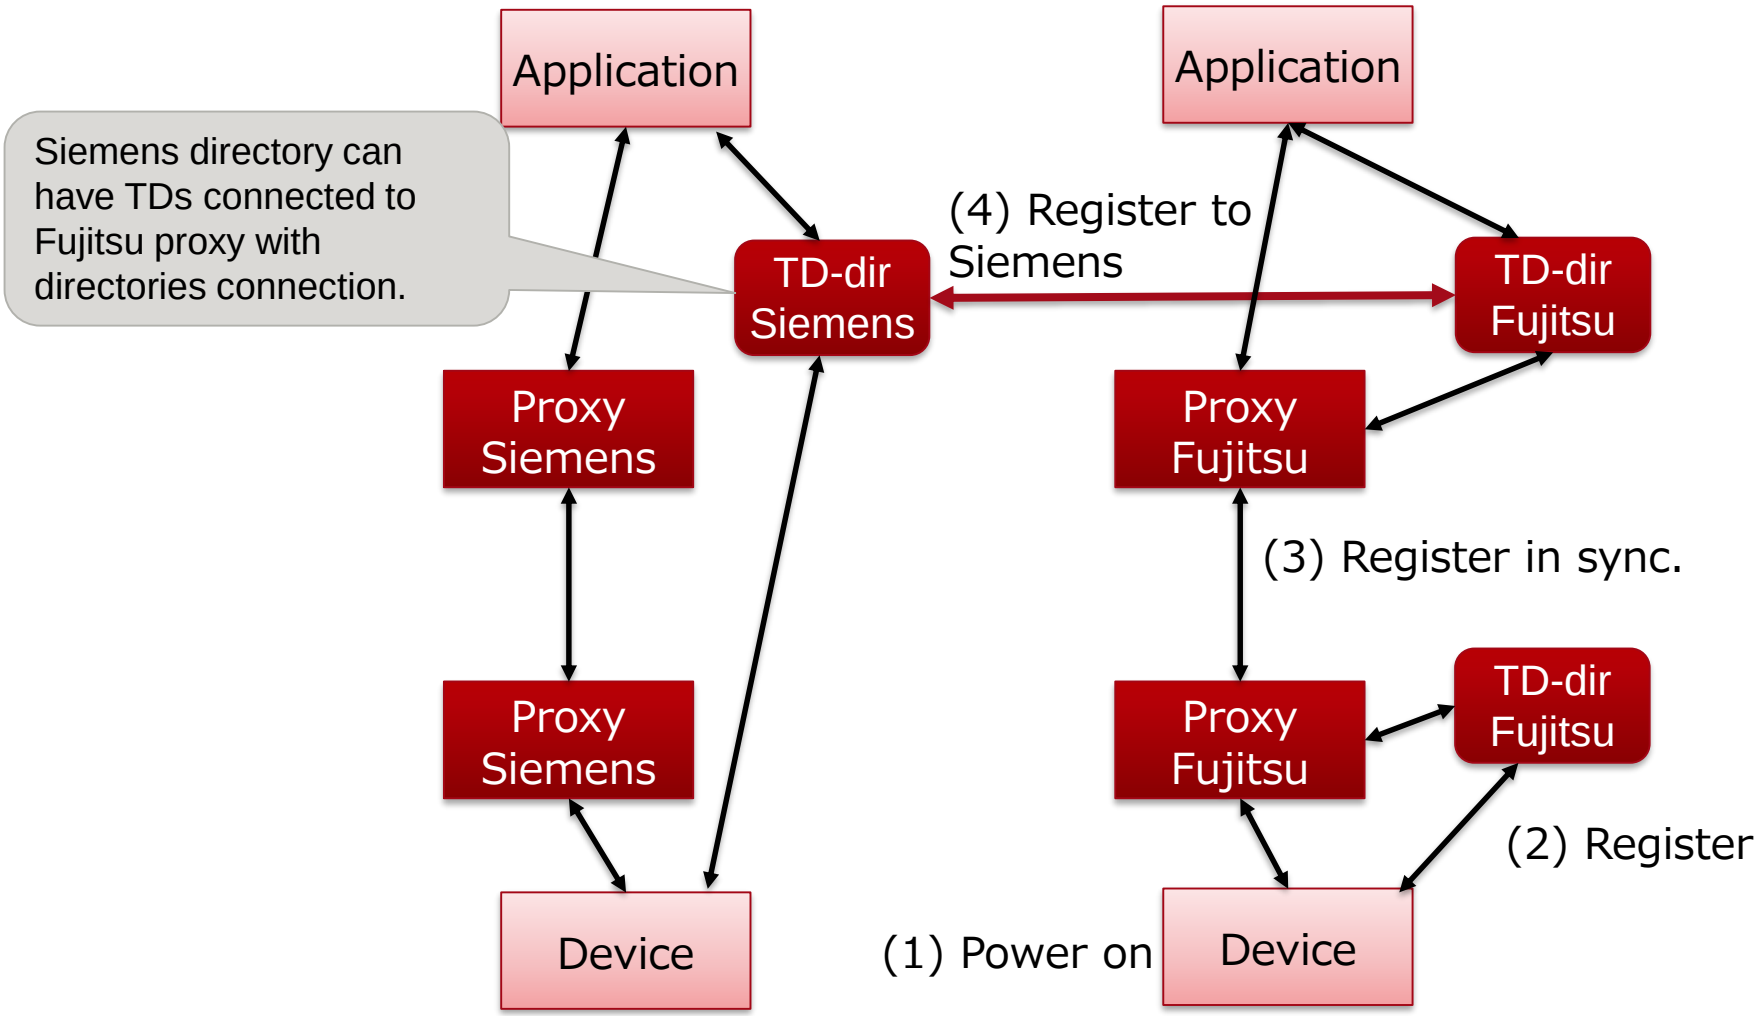
Connection with Siemens proxy

- Fujitsu Remote proxy servient can connect to Siemens local proxy with WebSocket



Connection with Siemens TD directory

- Fujitsu TD directory synchronize TDs of devices to be connected to Fujitsu Proxy to Siemens directory.

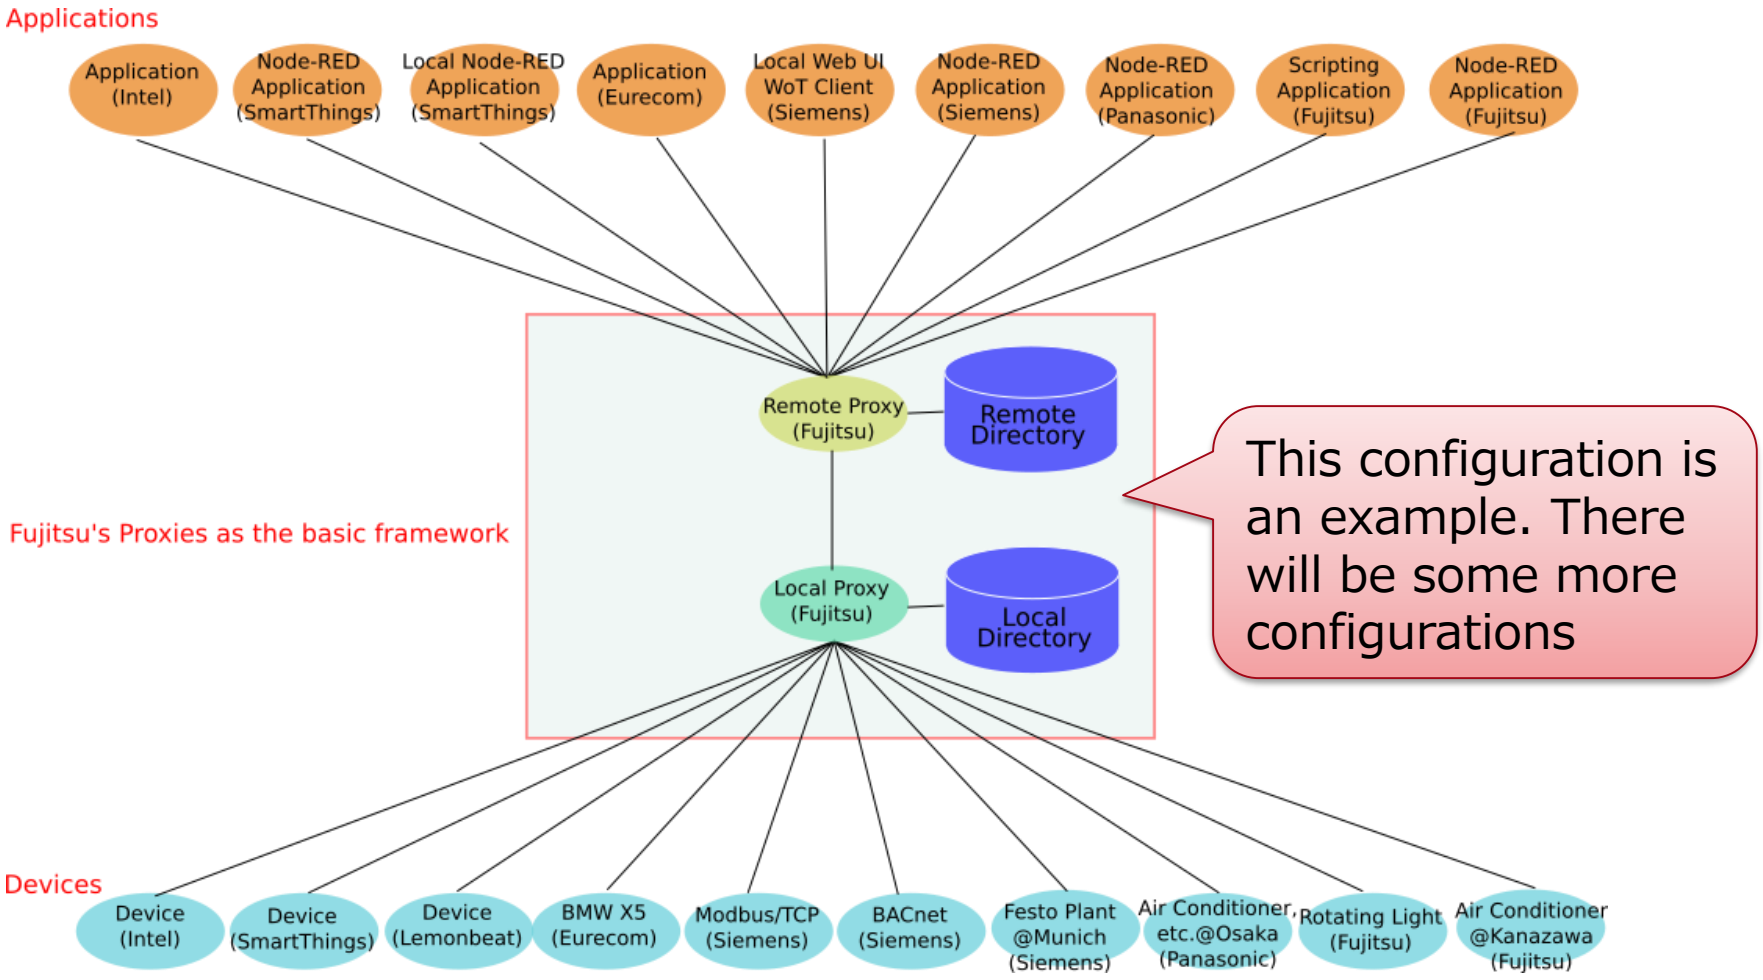


Integration by proxy servients

- WoT proxy servient can coordinate Non-WoT entities
  - Oracle IoT Cloud Service
  - ECHONET Lite, EtherCAT
  - Various kind of applications and devices will be coordinated.

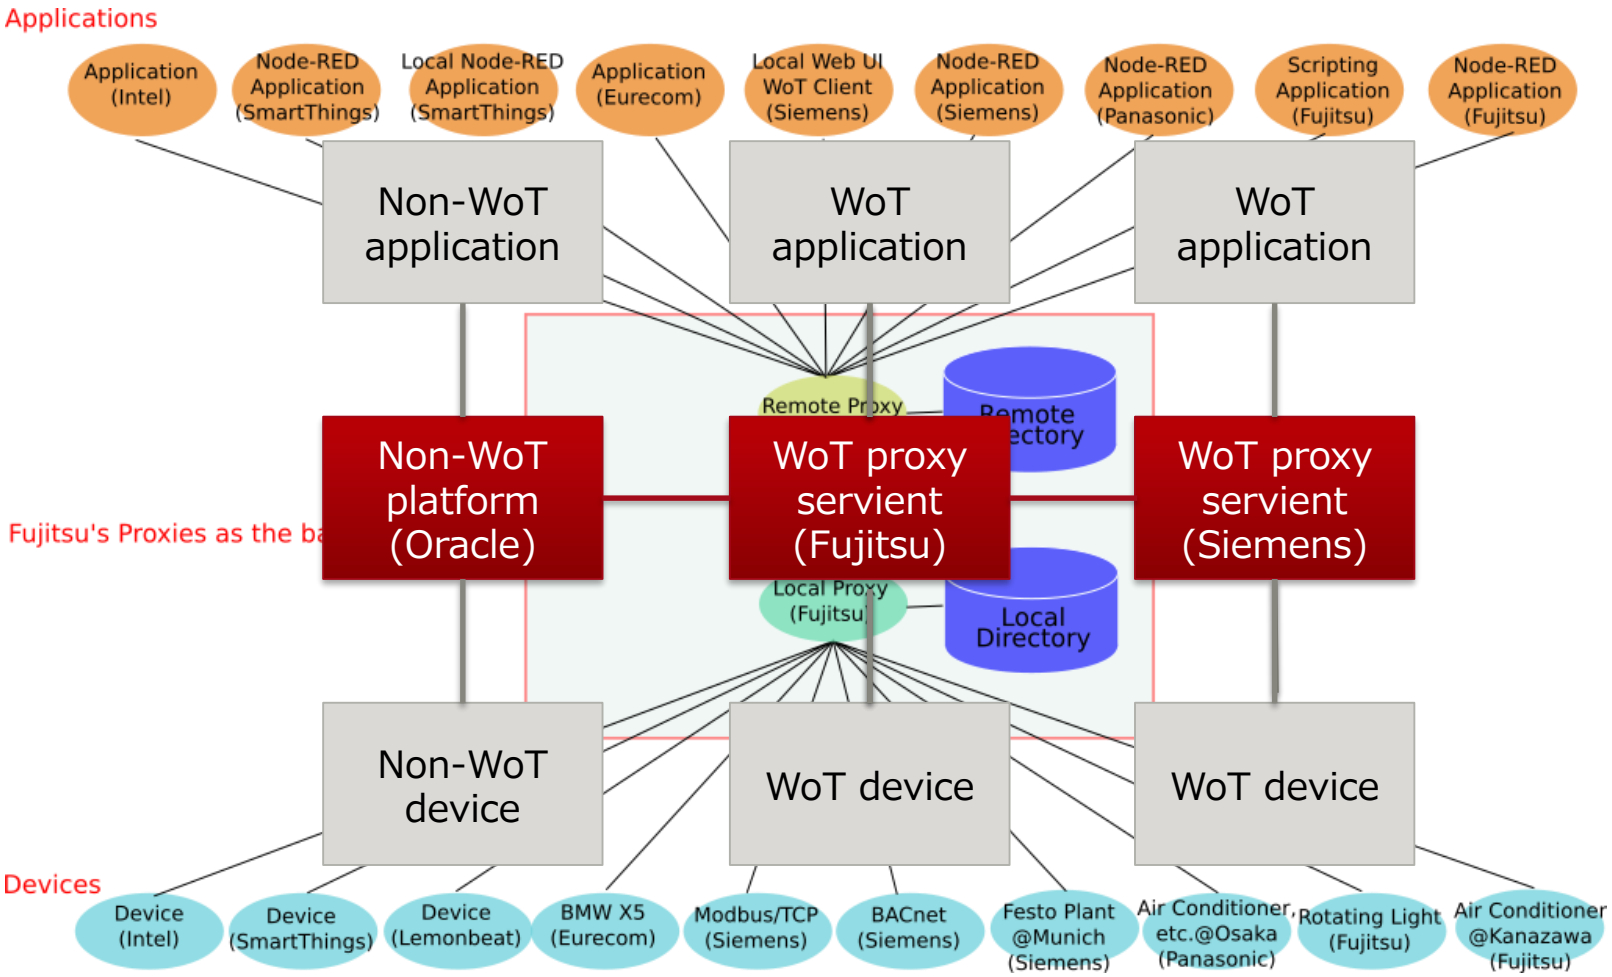
Narrow Waist model

- Proxies coordinate the connections between applications and devices.



Various connection patterns for Narrow Waist model

- Proxies cooperation makes much more connections
  - Not only **WoT servients** but also **non-WoT** can be integrated.



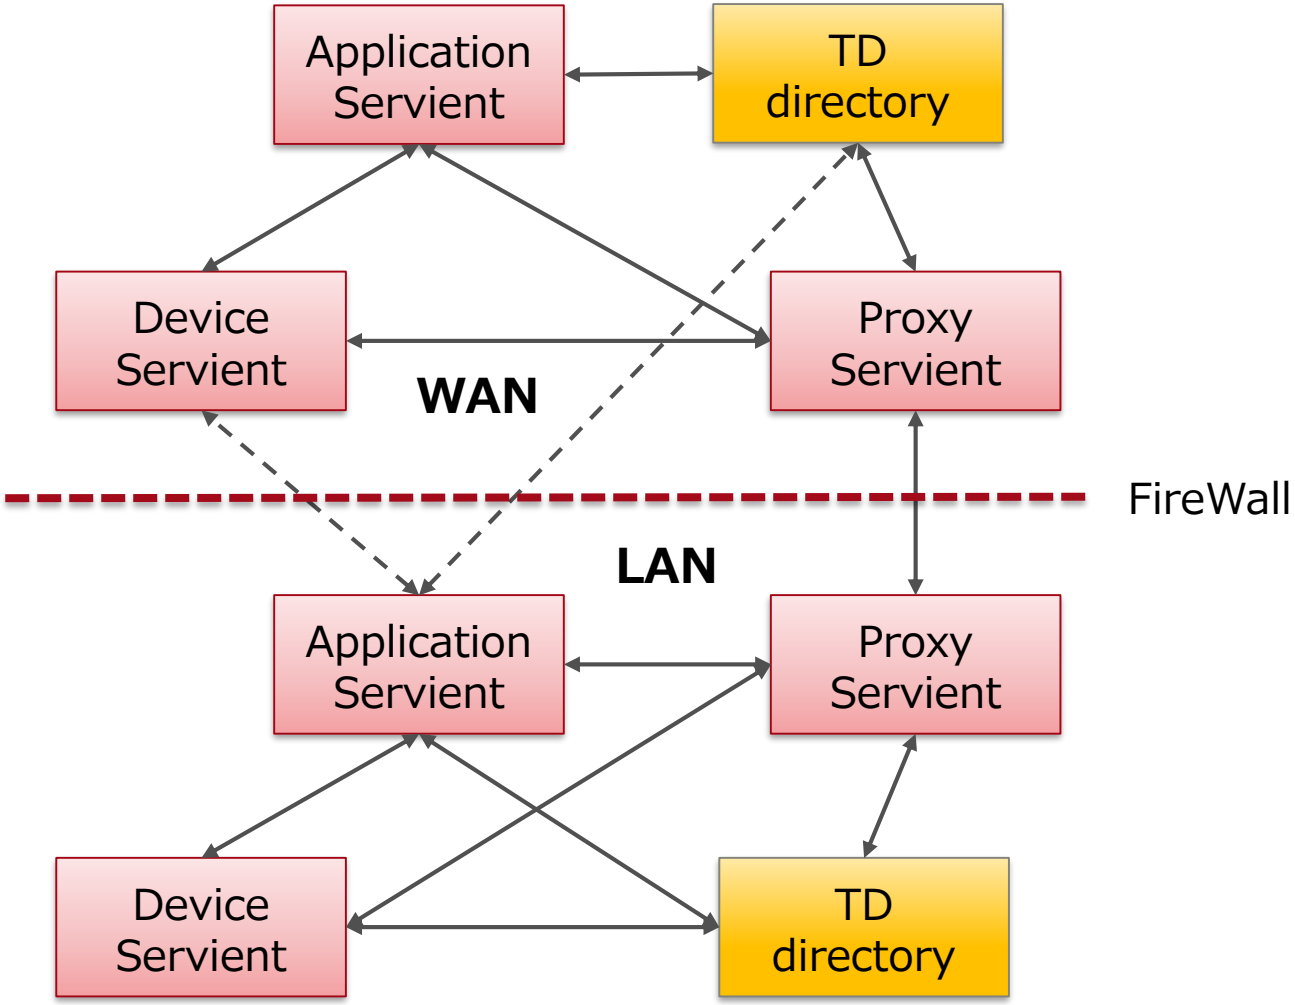
FUJITSU

Various connection patterns

- Consideration of potential configurations

System Architecture from Koster's slide

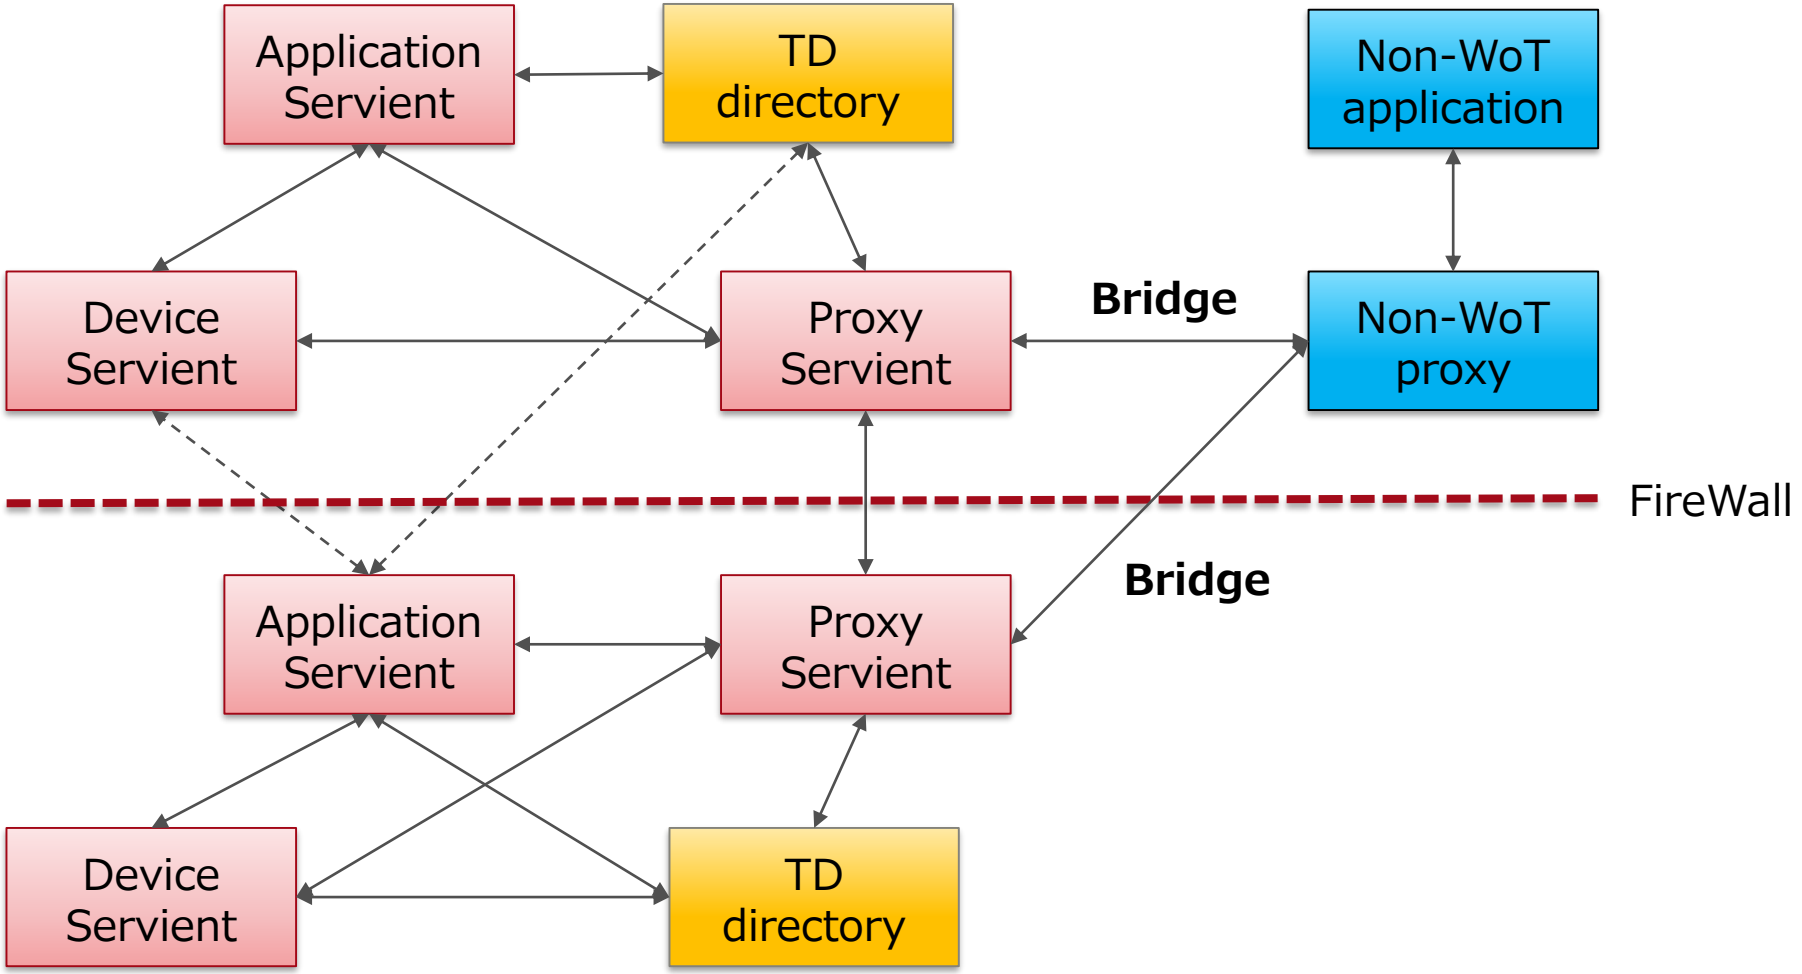
- Proxy connect Servients on both of WAN and LAN.
  - Each TD directory provide TDs with proper URL.



System Architecture with Non-WoT

FUJITSU

- Integration with Oracle IoT Cloud Service
  - Connected to Proxy Servient with bridge for Non-WoT entities

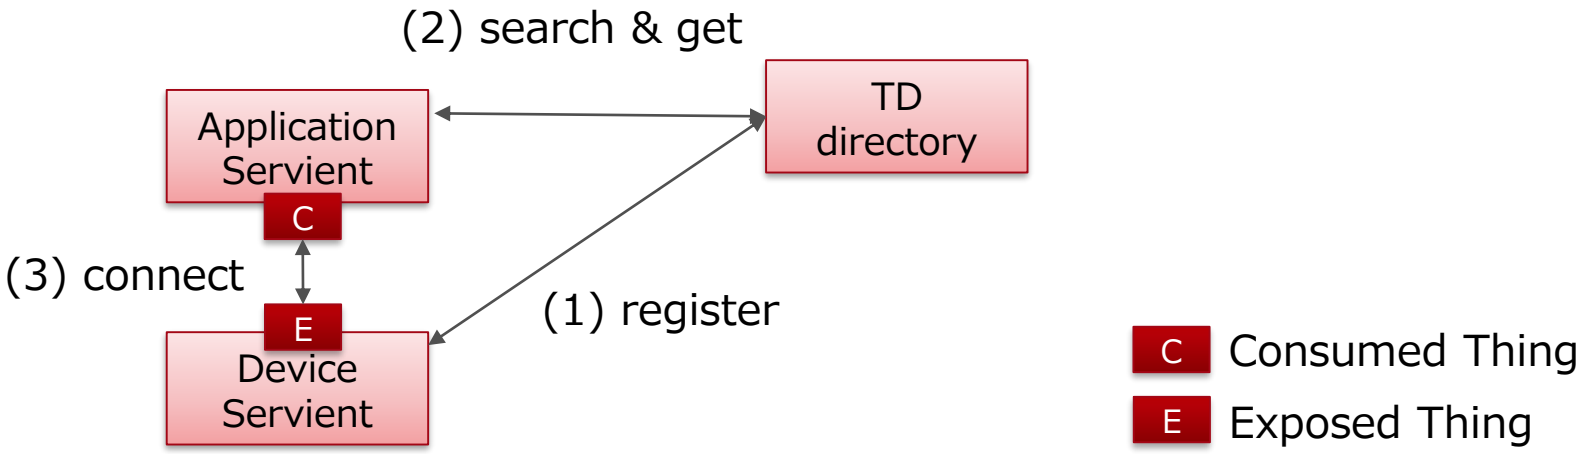


Servients integration

FUJITSU

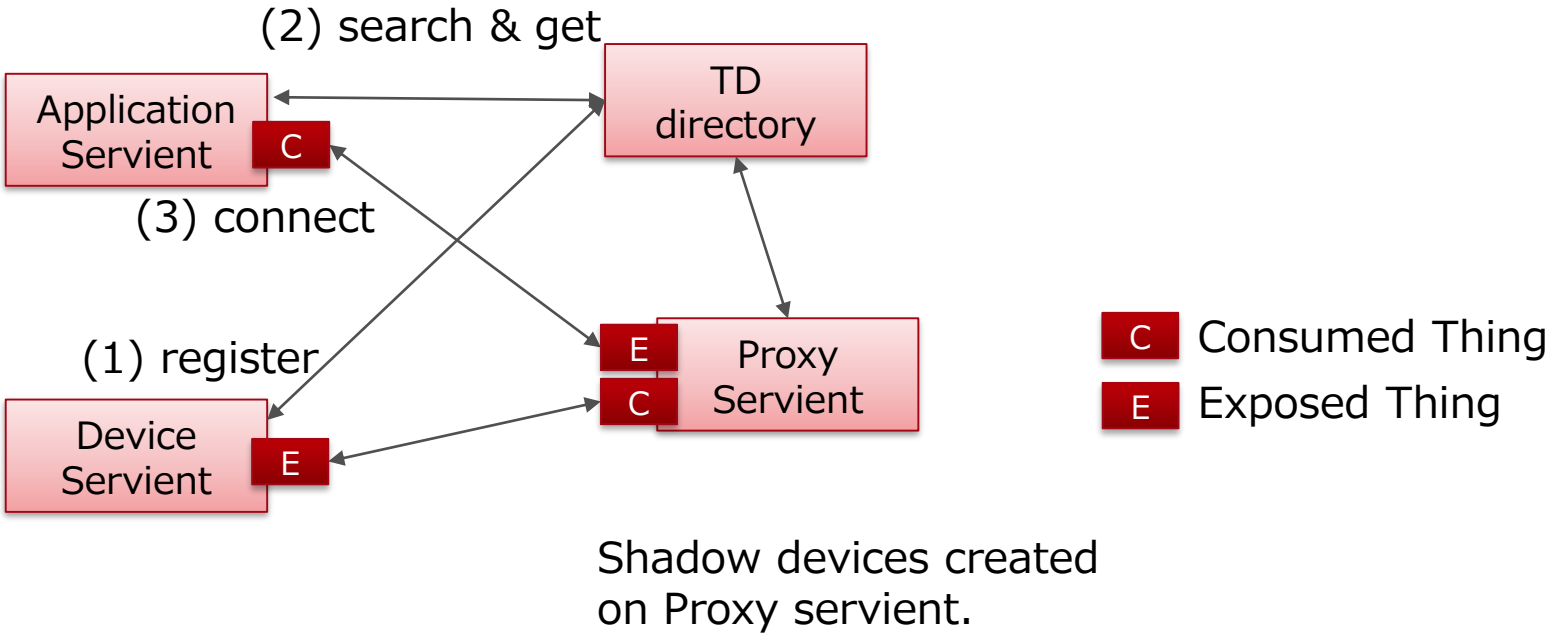
Connection pattern 1:
- Application and Device

- Application Servient directly connect to Device Servient.
  - Device Servient registers own TD to the directory.
  - Application Servient searches and get TD of the device, and connects to the Device servient.



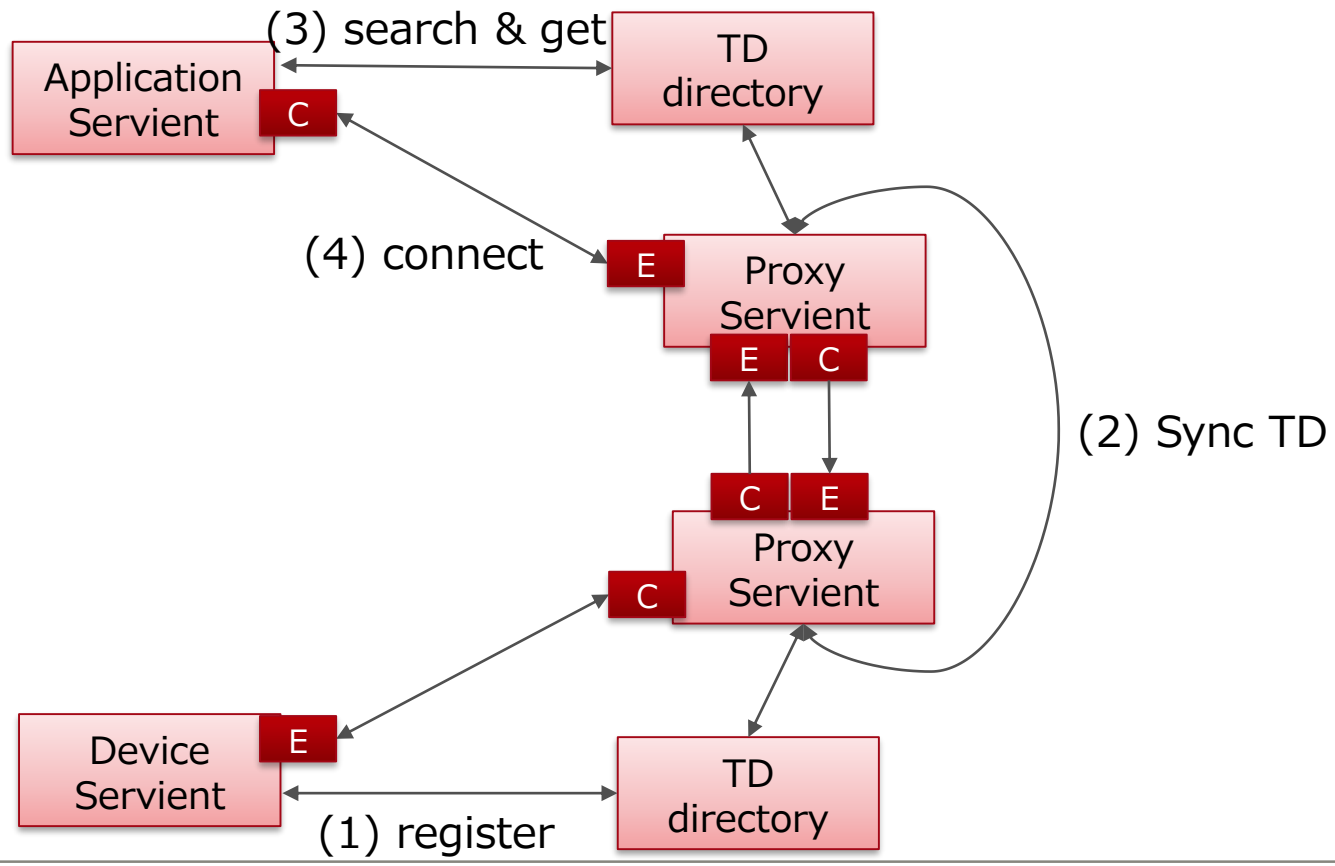
Connection pattern 2: - Proxy servient

- Application Servient connects to Device via Proxy.
  - Device Servient register own TD to the directory
  - Application Servient searches and get TD of the device, and connects to the Device Servient via Proxy Servient.

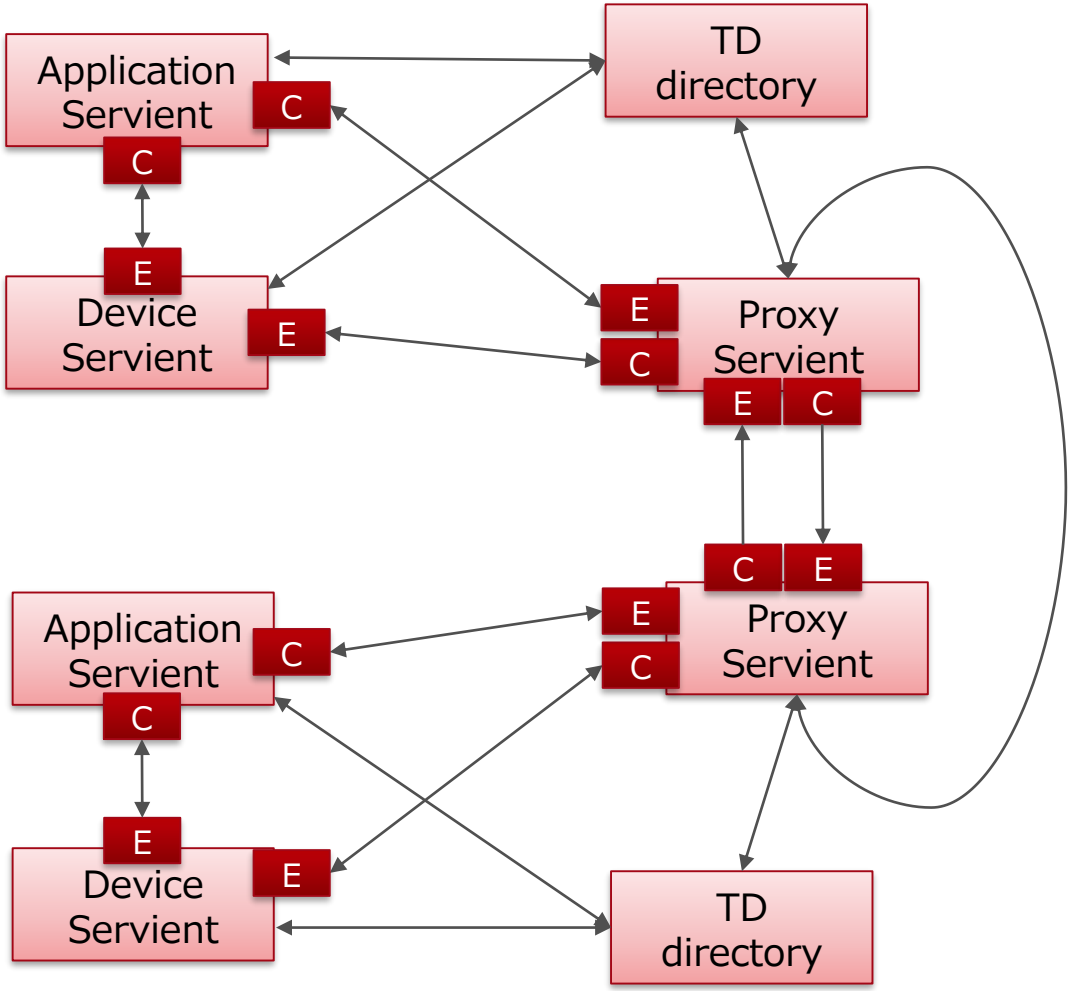


Connection pattern 3:
- WAN app. and LAN device

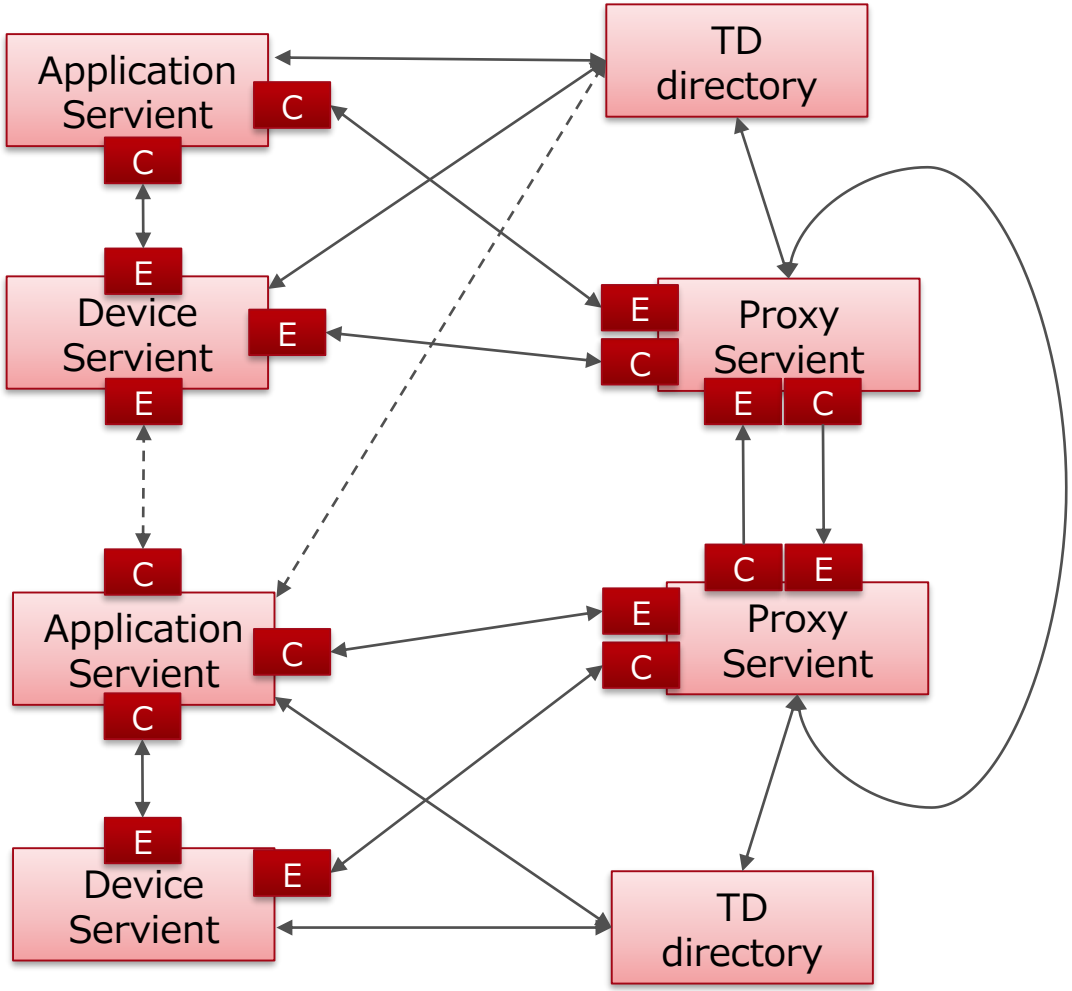
- Application on WAN connects to Device on LAN via Proxy.
  - Local directory synchronizes TD of local device to Remote directory. TD on remote directory is globally accessible.



Connection pattern 4: - Orchestration



Connection pattern 4:
- Orchestration



Abstract interface definition for various connection patterns

FUJITSU

- Servient and TD directory abstract interfaces
  - Actual interfaces are defined by Binding template
  - Why don't you call the following interfaces "**WoT interface**" ?

Interfaces between Consumed and Exposed Thing

Consumed	direction	Exposed	
ReadProperty	→		
WriteProperty	→		
Subscribe	→		
	←	Event	
Action	→		

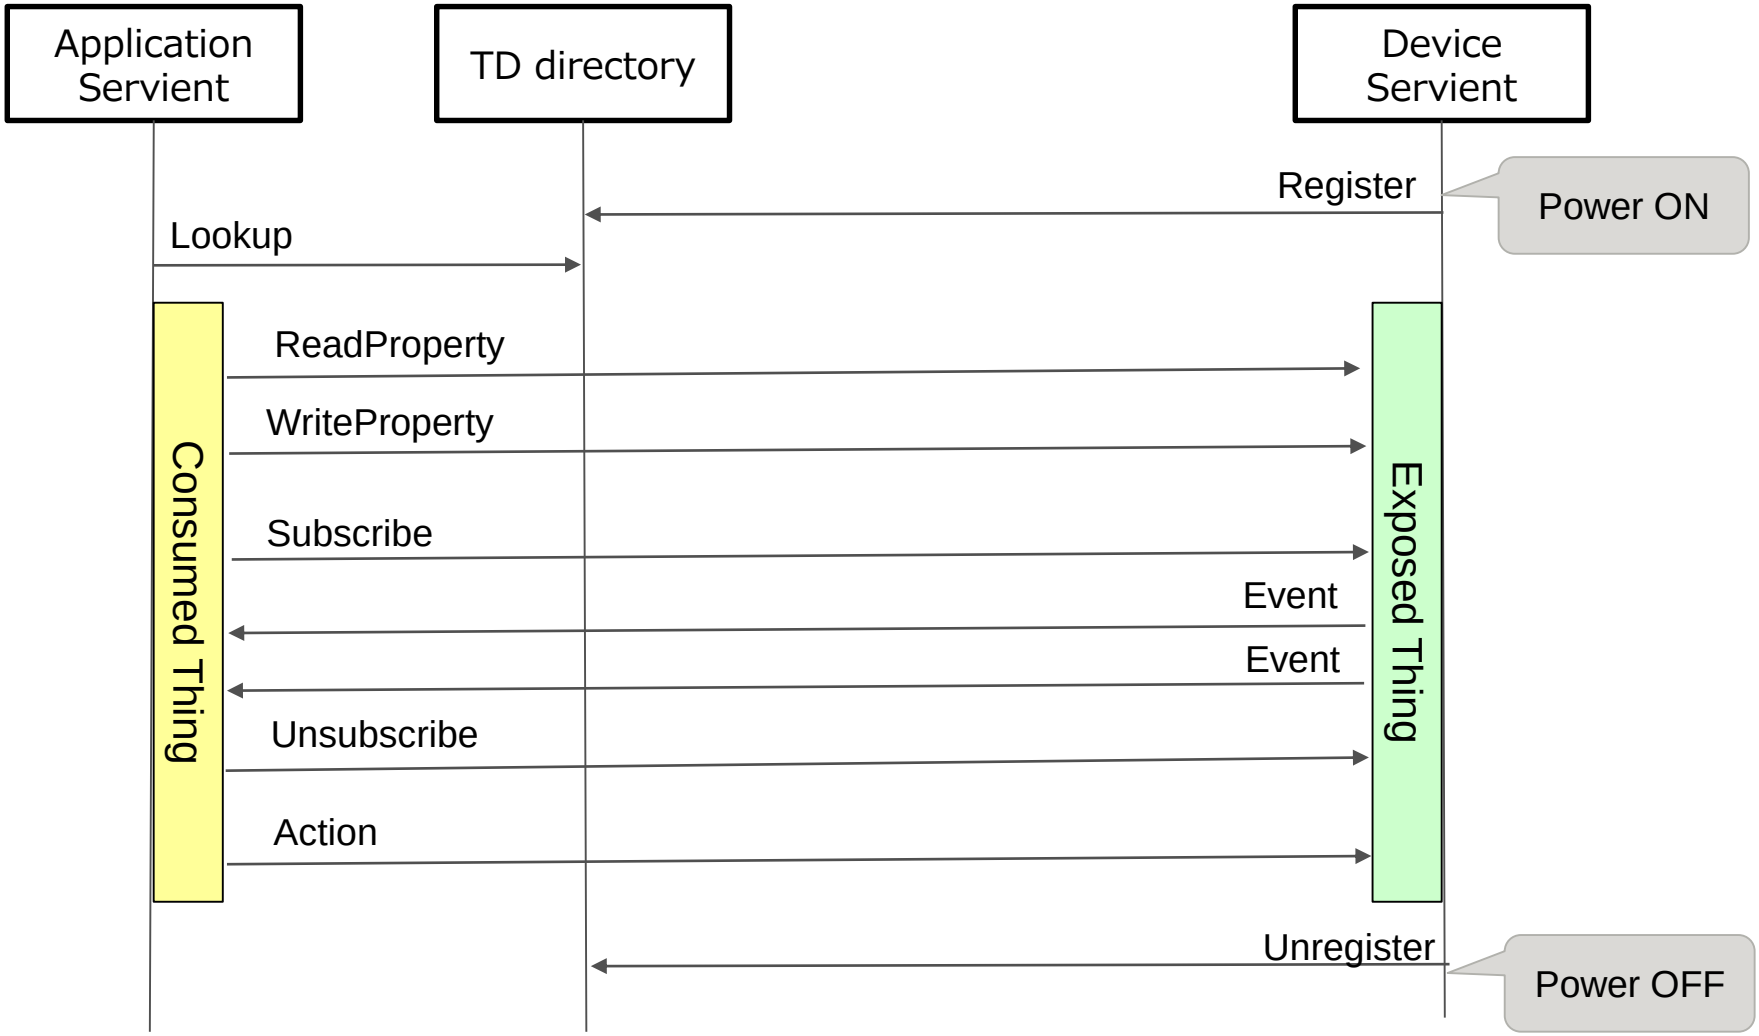
Interfaces between Servient and TD directory

Servient	direction	TD directory	
Register	→		Register TD to dir.
Lookup	→		Search and get TDs from dir.

Overview of sequence diagram (1/2)

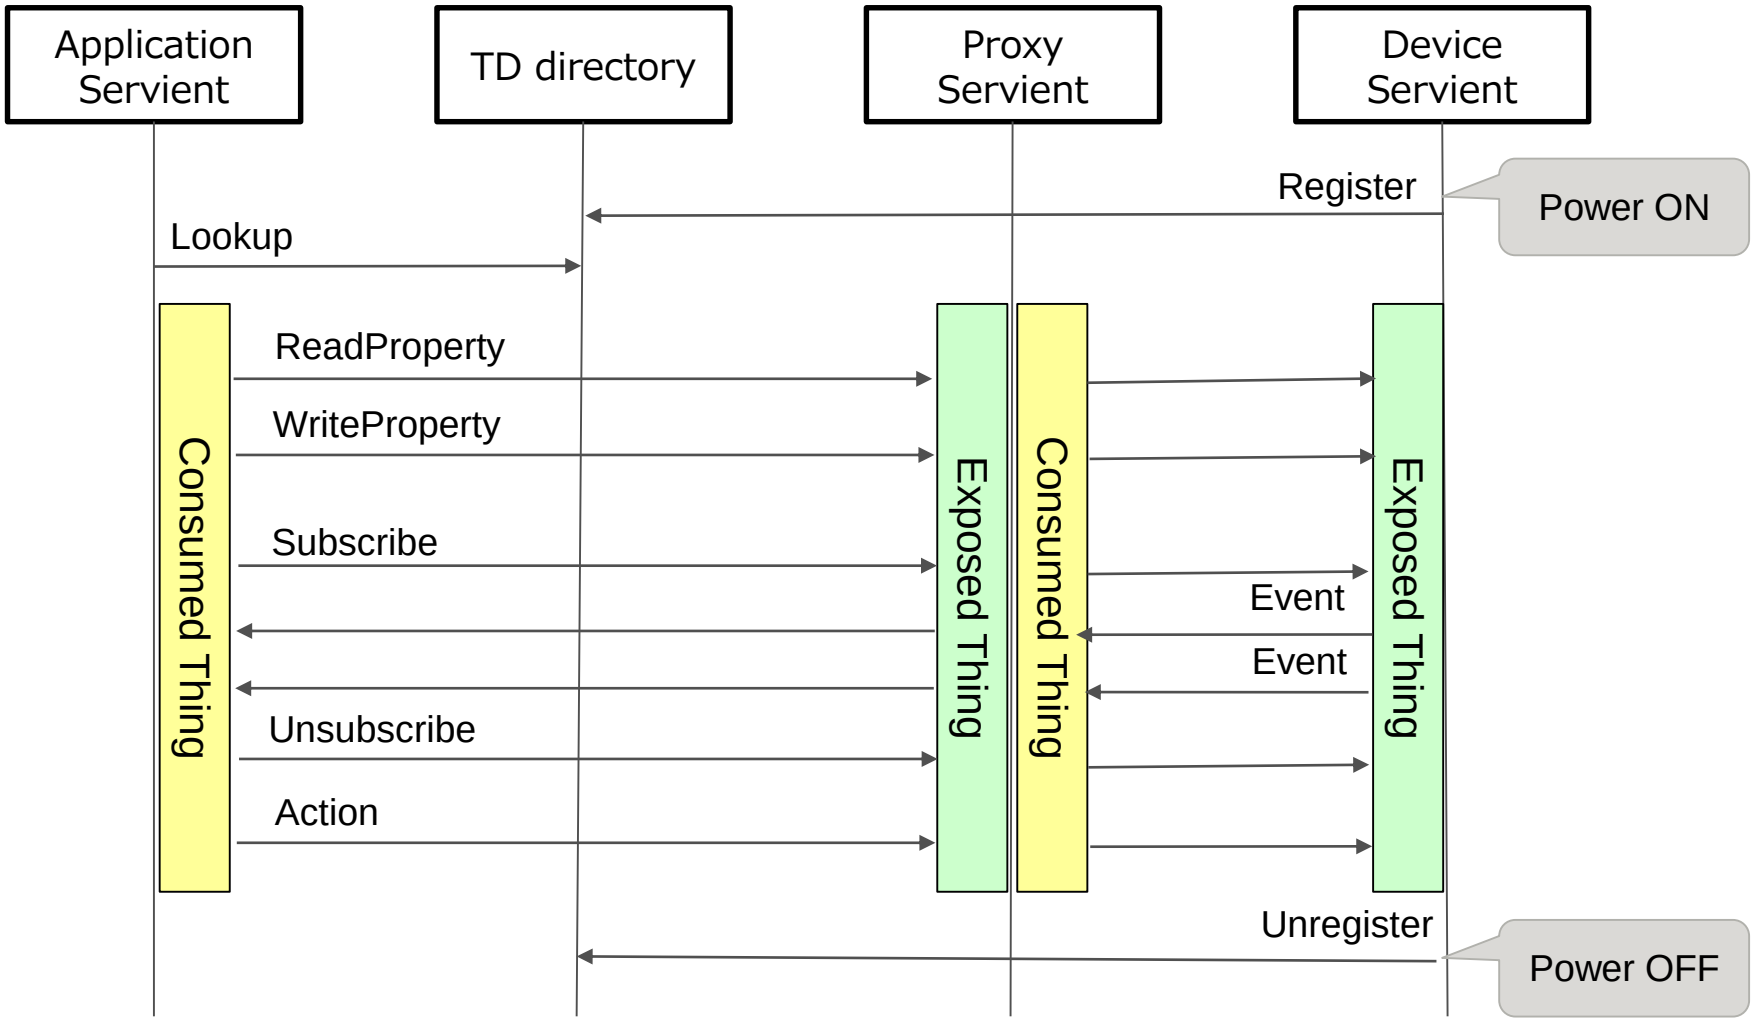
FUJITSU

- Sequence of abstract interface between applications and devices.



Overview of sequence diagram (2/2)

- Sequence of abstract interface with proxy servient.



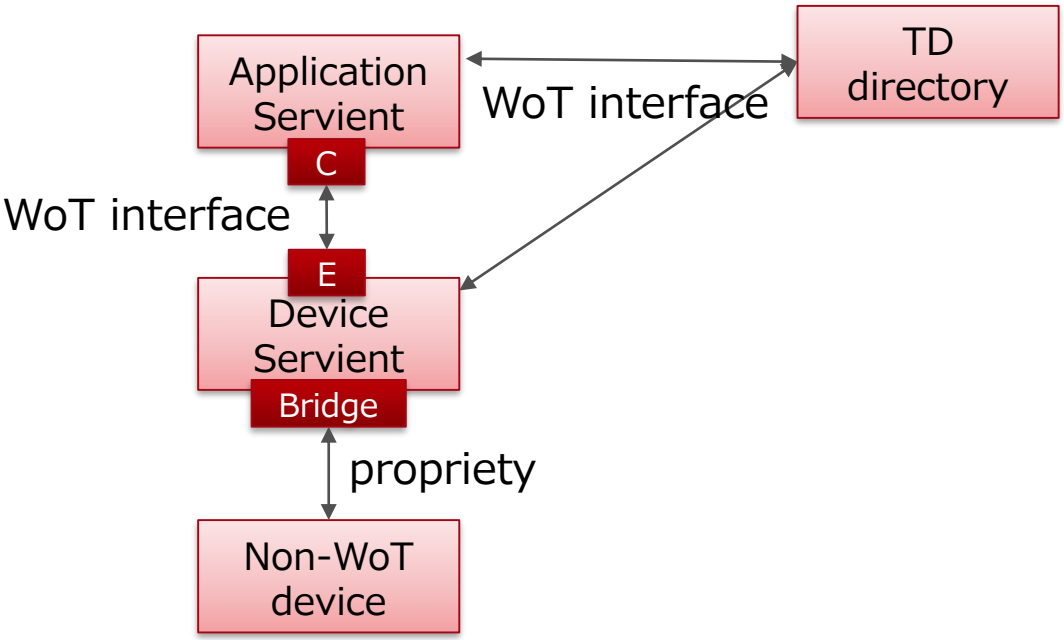
FUJITSU

Interaction with non-WoT devices

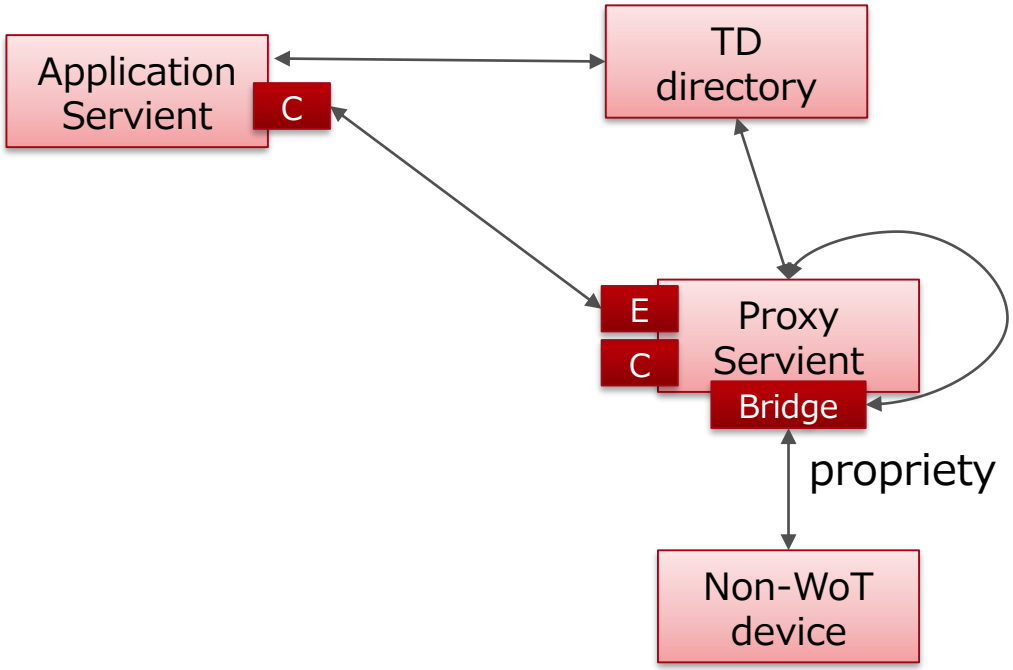
How to connect Non-WoT entities

FUJITSU

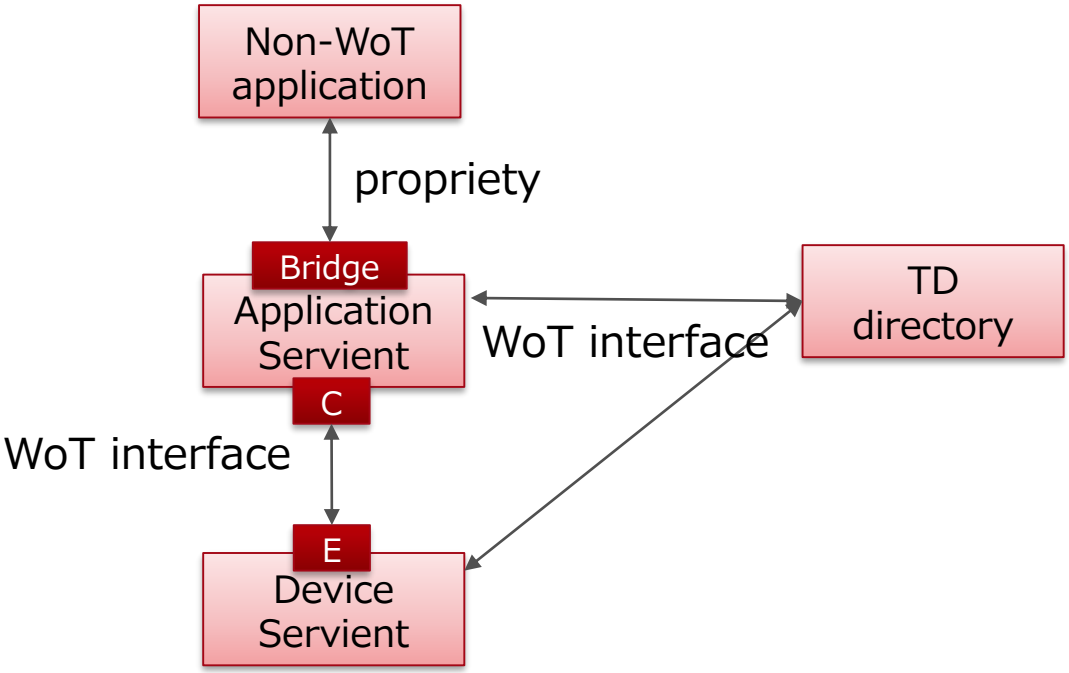
Device with non-WoT binding



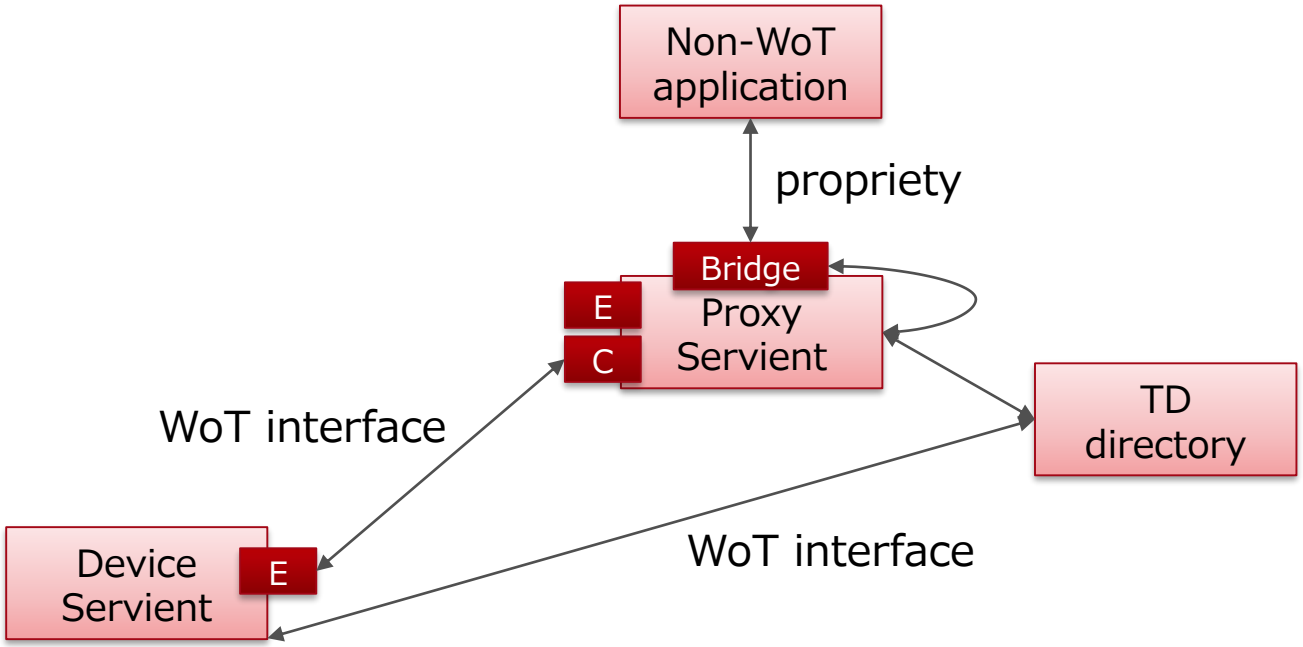
Proxy with Non-WoT device binding

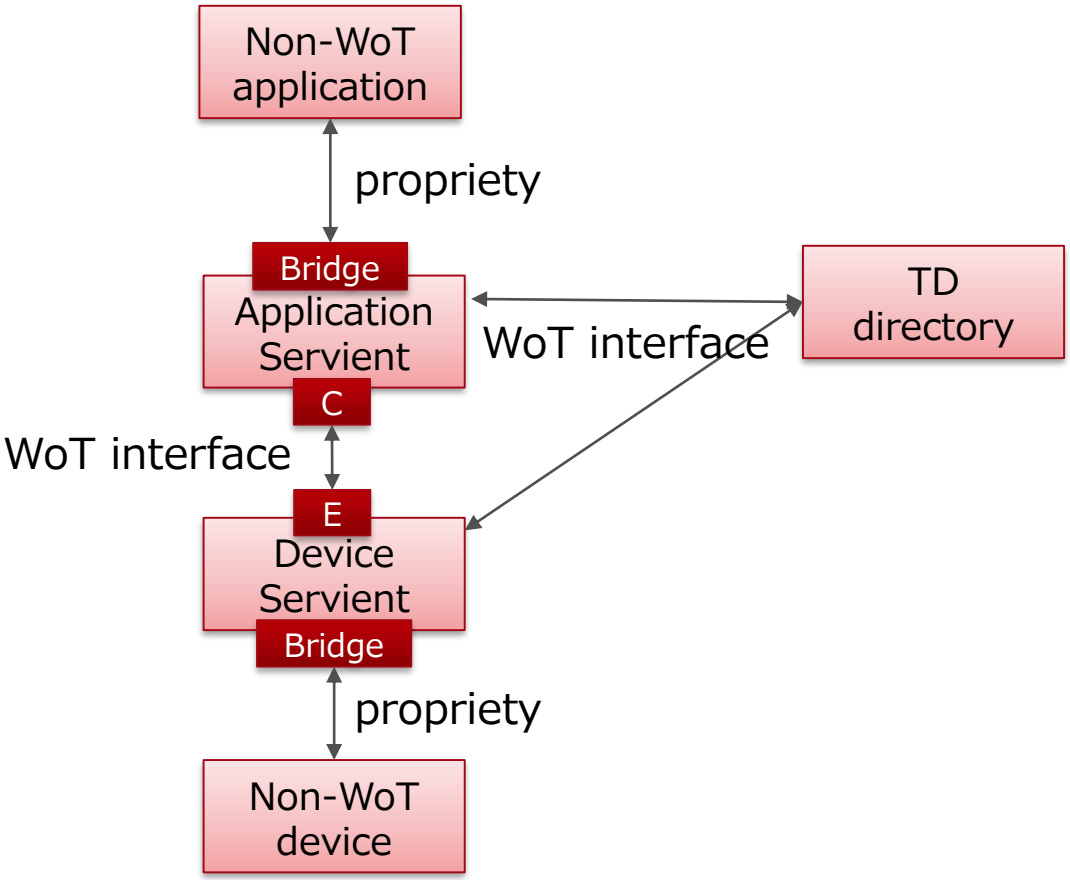


Application with Non-WoT binding



Proxy with Non-WoT binding



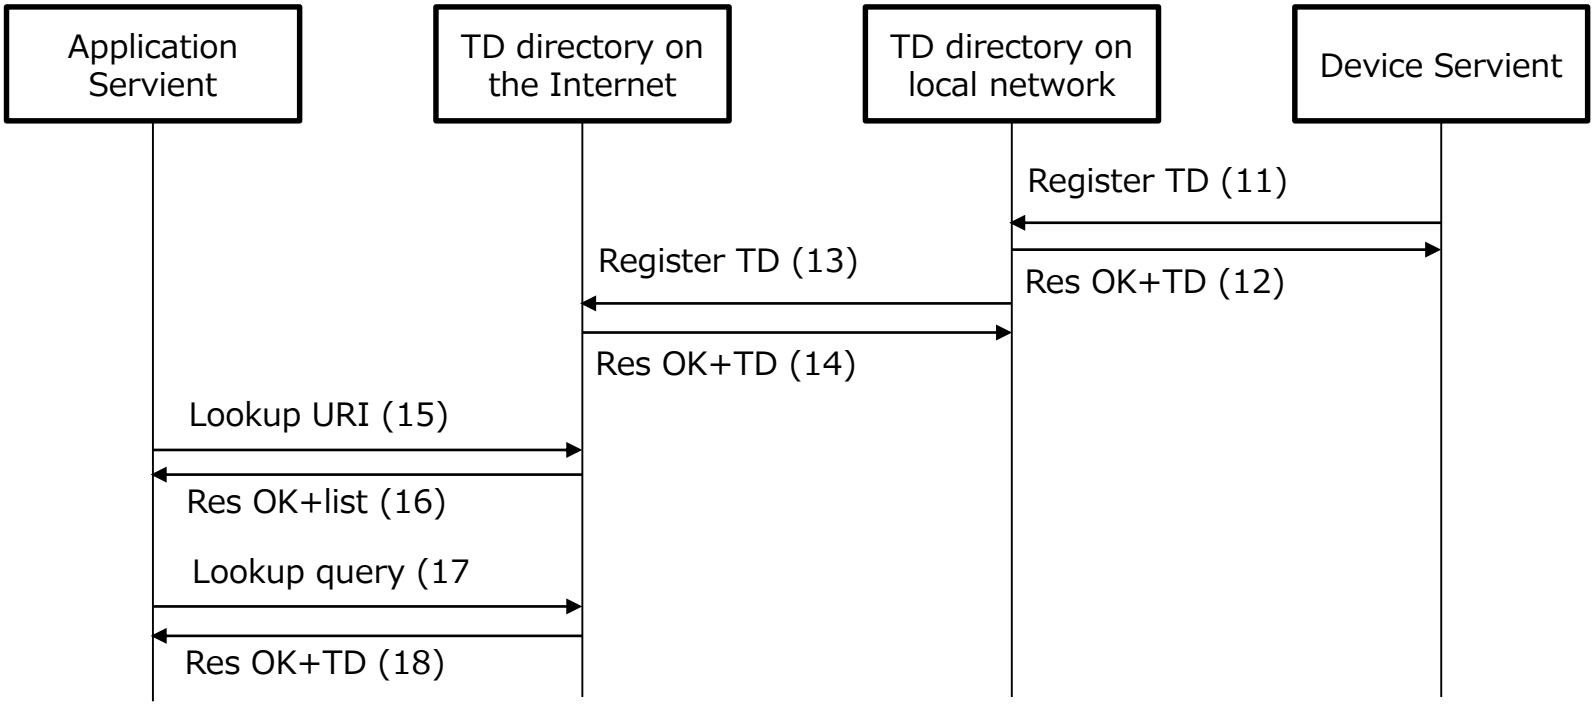


Proposals

FUJITSU

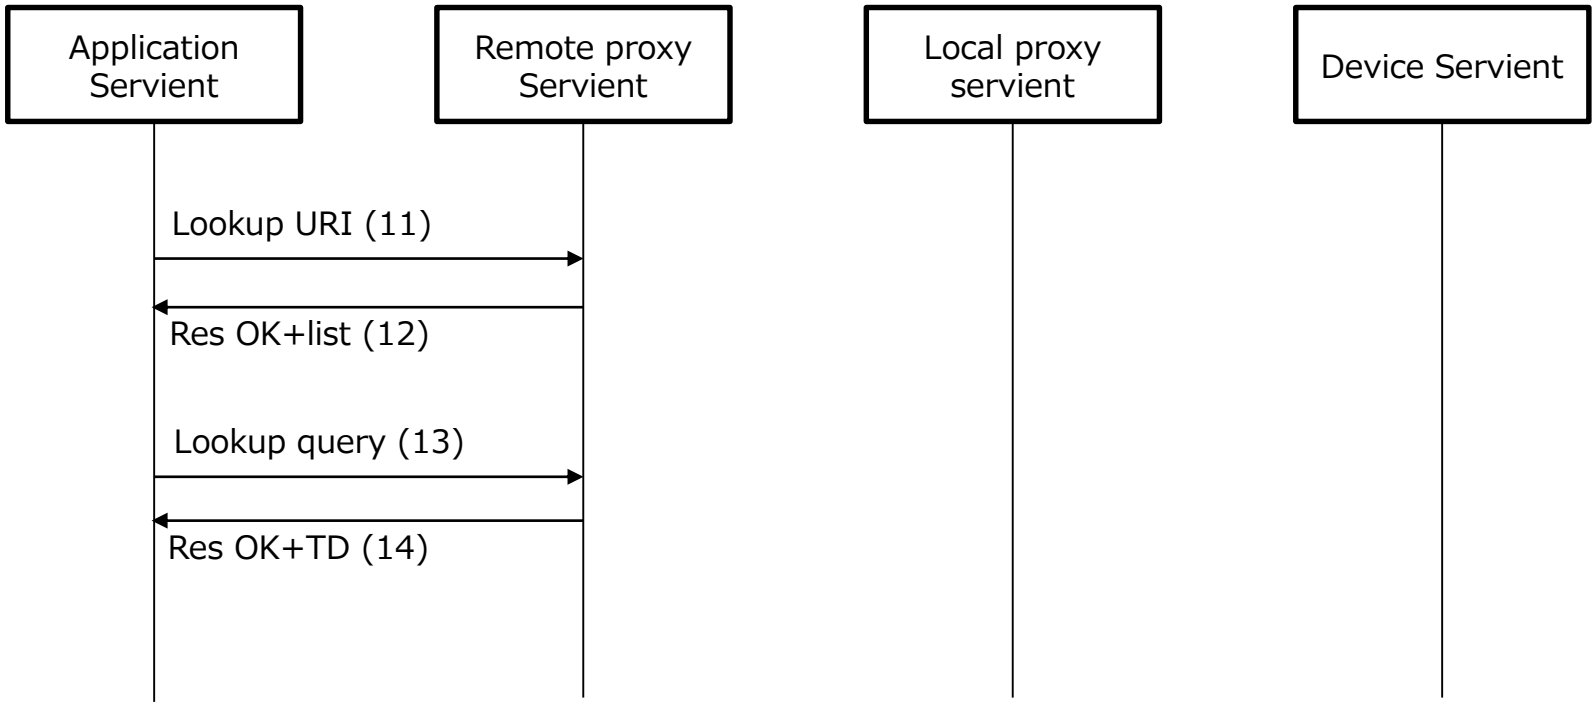
Register

- A device servient is registered to the local proxy servient and remote proxy servient. The proxy servient returned the TD with public uri. The proxy servients have TD repositories to store TDs registered from the other servients.



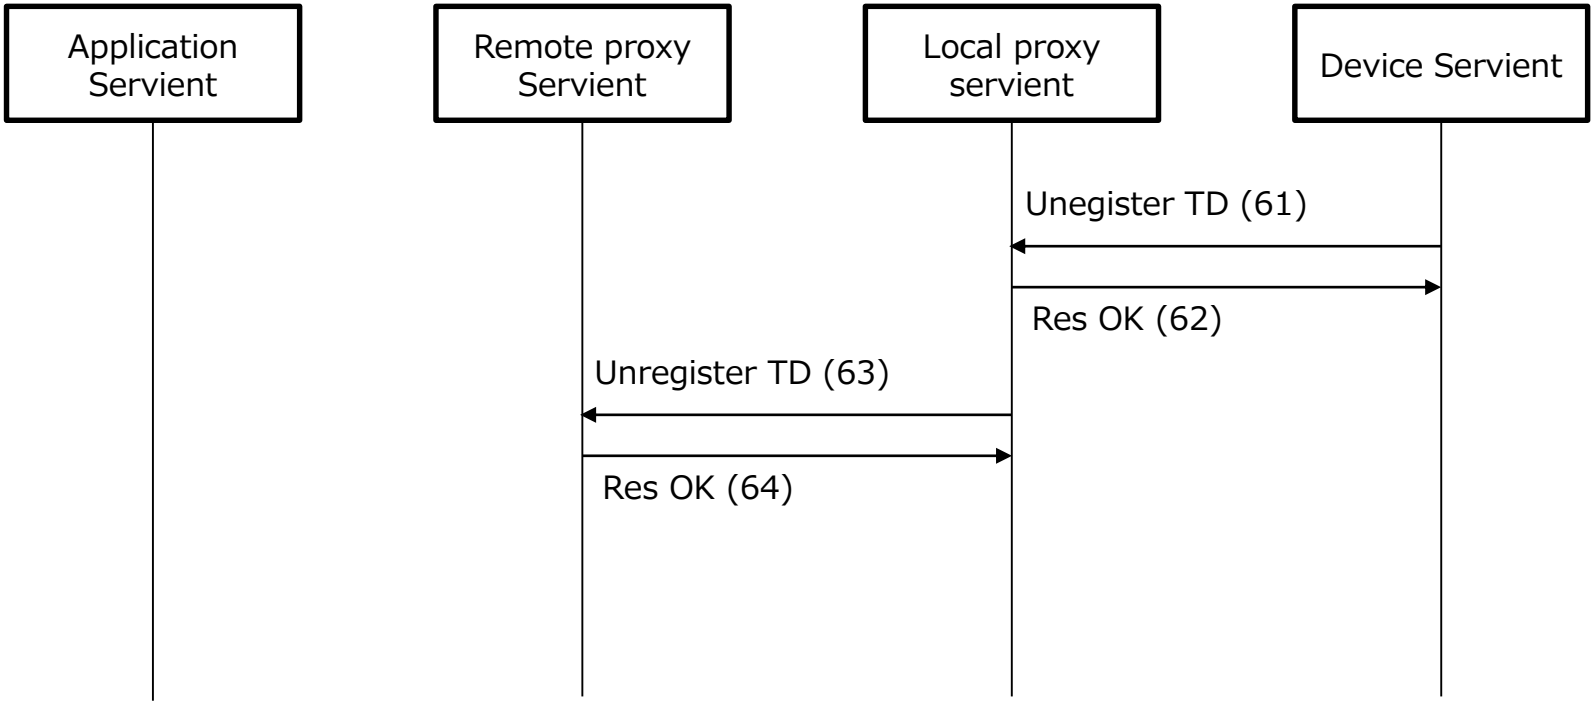
Lookup

- An application servient can lookup TDs registered the remote proxy servient with its URI. If the URI indicates the servient, it returns the list of the devices connected. If the URI specifies the devices registered on the proxy servient, it returns TD of it.



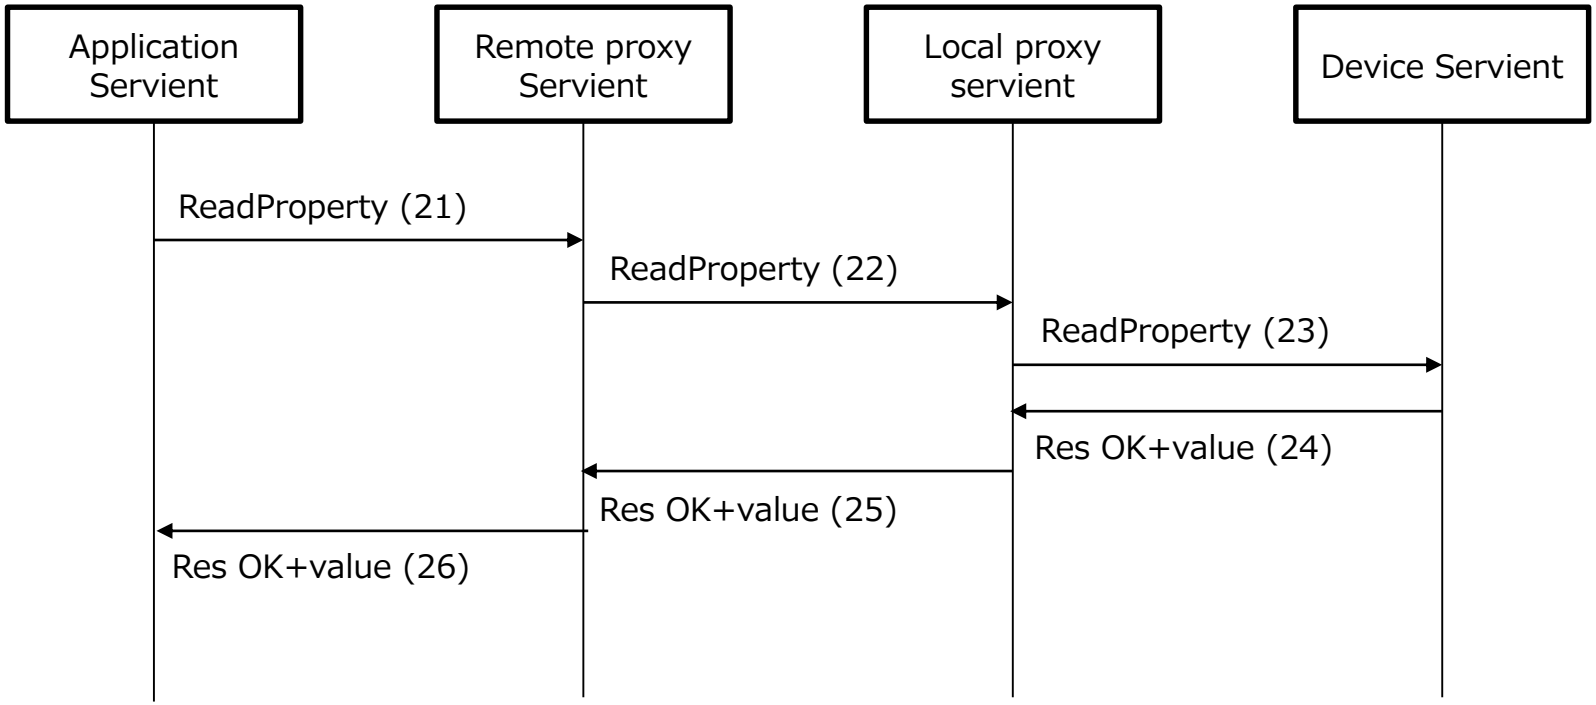
Unregister

- The device servient unregister from the local proxy servient before shutdown. The local proxy servient unregister this device servient from the remote proxy not to access from the application.



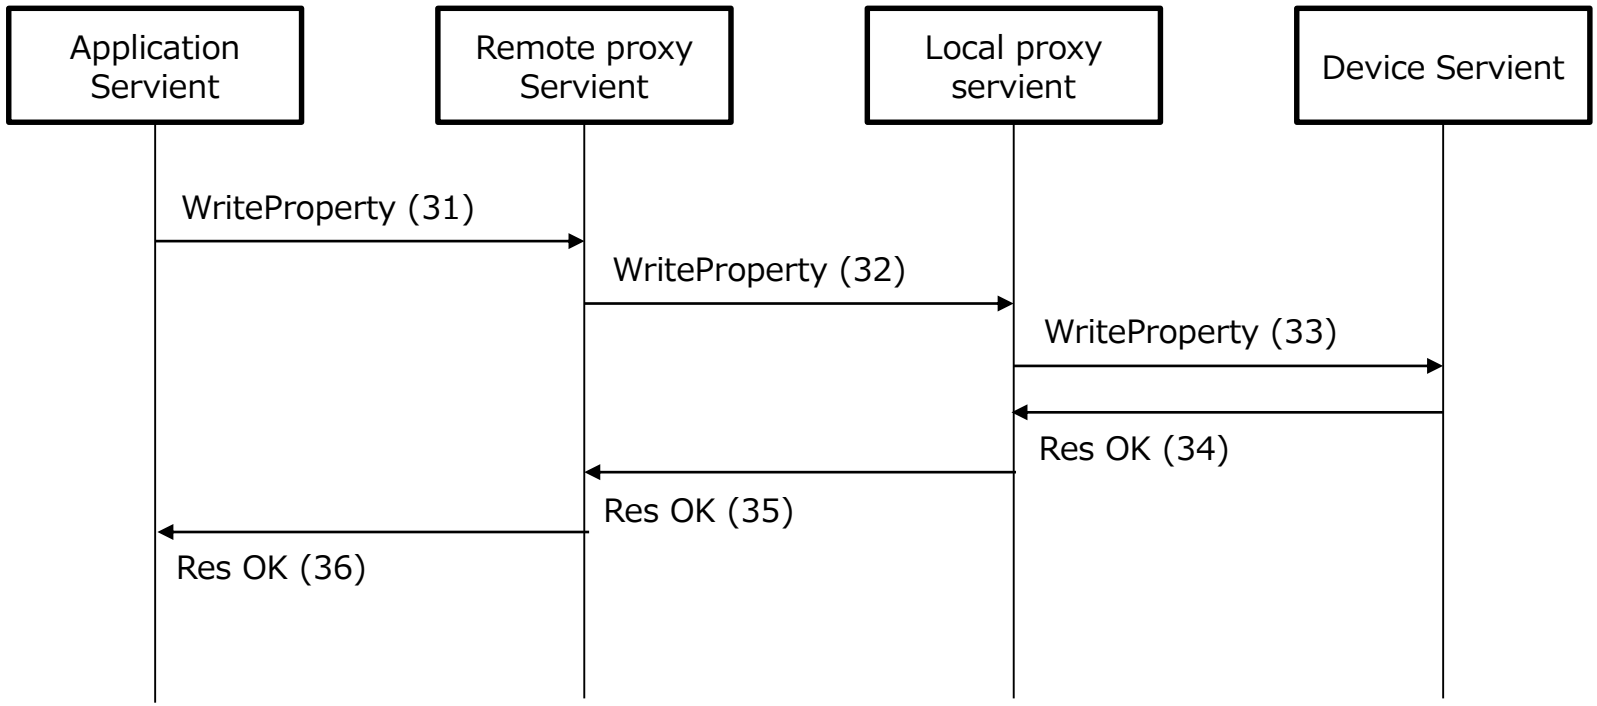
ReadProperty

- The application servient sends a request to read the value of the property of the device servient to the remote proxy servient. The remote and local proxy servient relay to this request to the device servient.



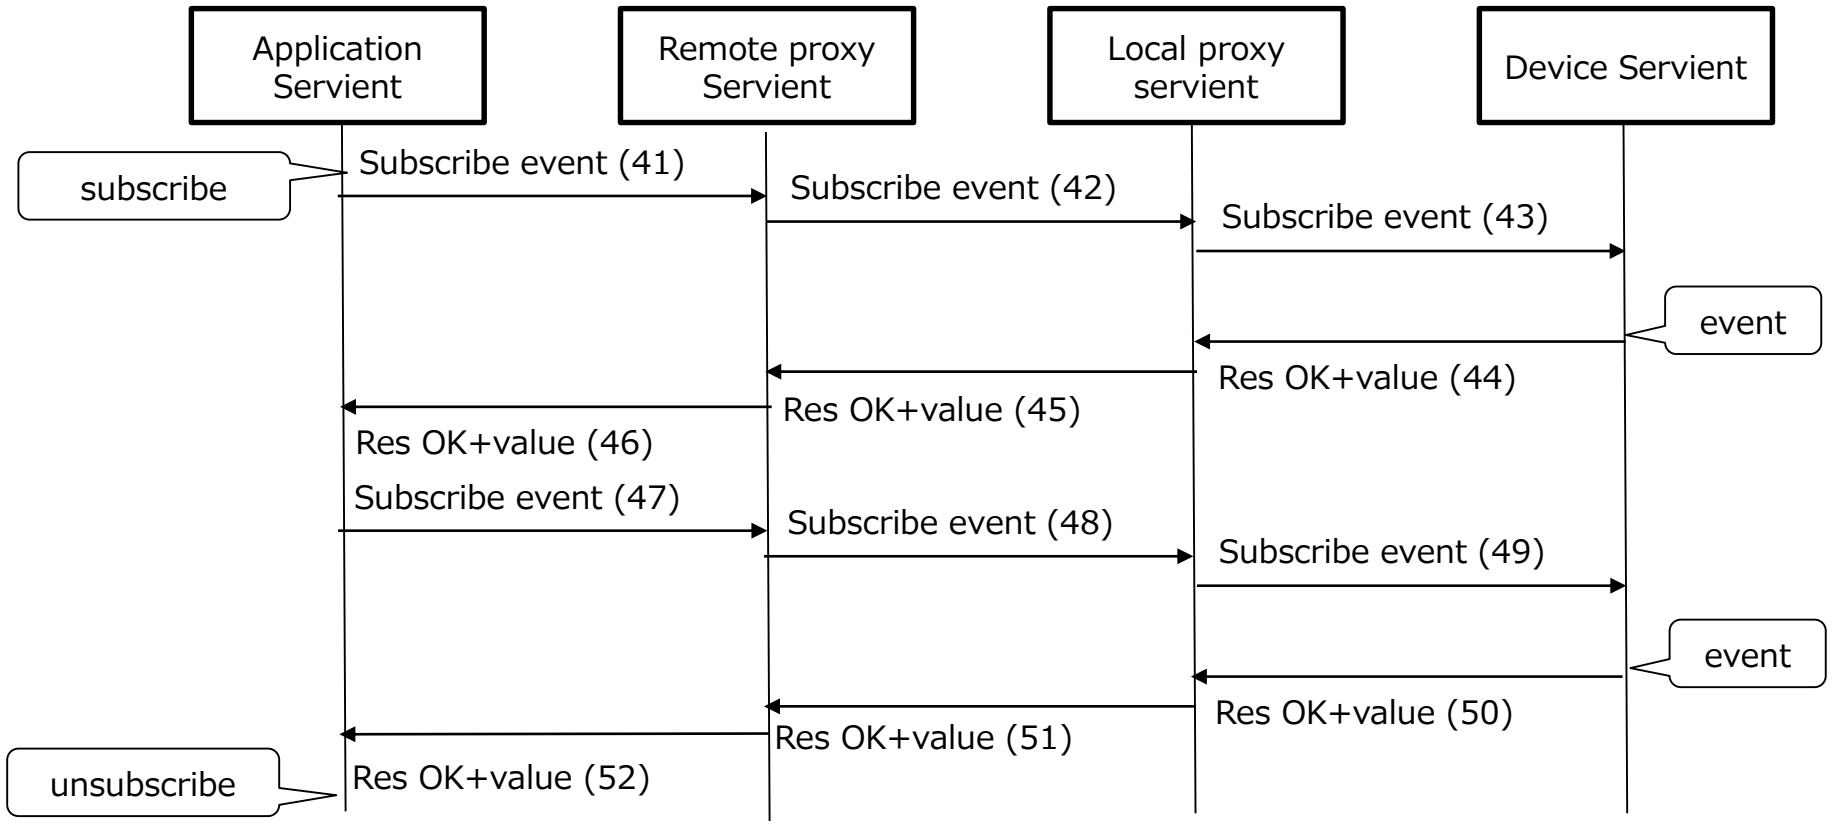
WriteProperty

- The application servient sends a request to write the value to the property of the device servient to the remote proxy servient. The remote and local proxy servient relay to this request to the device servient.



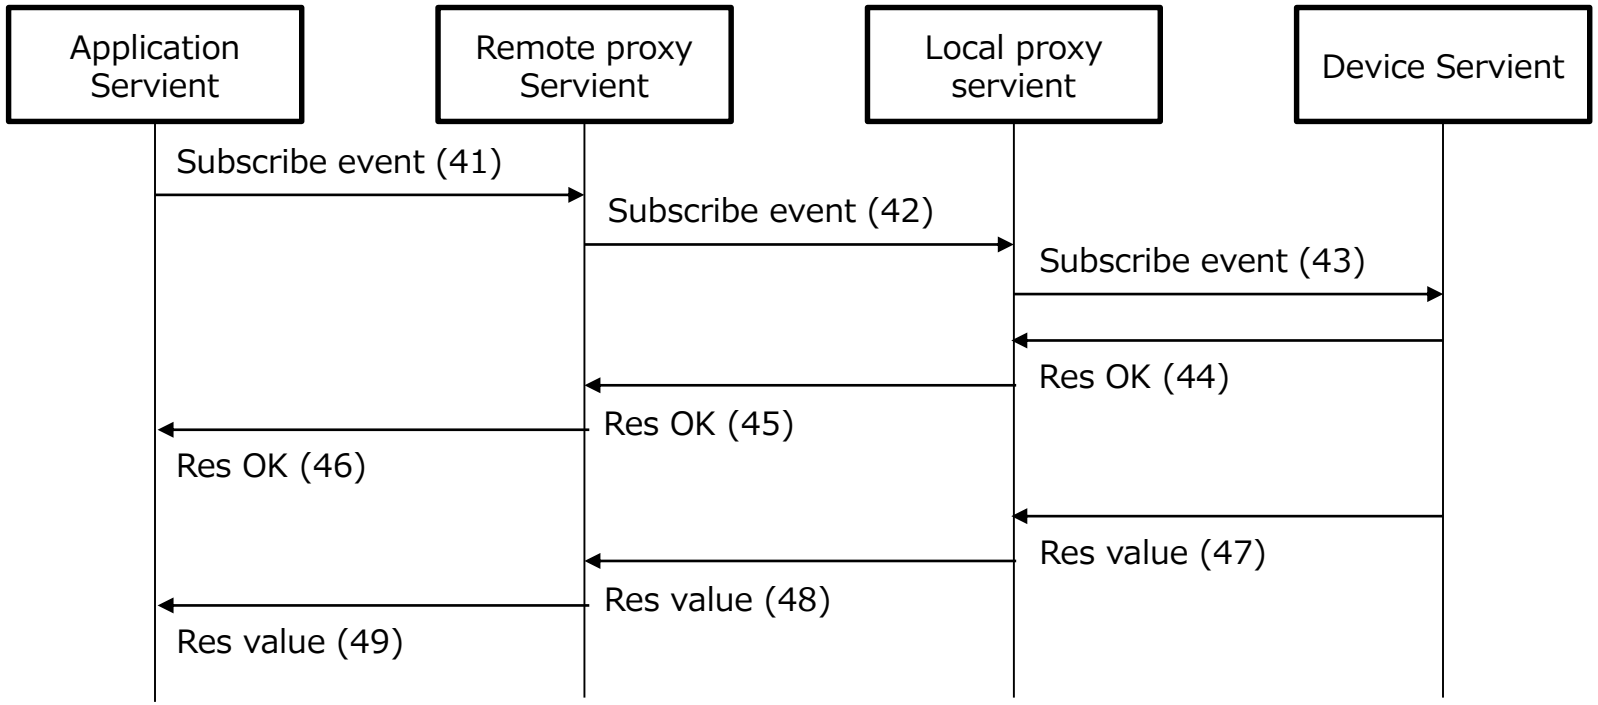
Subscribe and Event with long polling

- The application servient sends a request to subscribe the property of the device servient to the remote proxy servient. The device servient keep to send the value of the specified property periodically or when some events happen until the application unsubscribes.



Subscribe and event with Server Sent Event method

- The application servient can obtain the change or the current status of the device servient via proxy servient using subscription procedures. The application servient sends a request to subscribe the property of the device servient via the remote and local proxy servient. The device servient keep to send the value of the specified property periodically or when some events happen.



Unsubscribe

- The application servient sends a request to unsubscribe to the remote proxy servient to stop to notify the event from the device servient.
