

Baidu Smart Game-design, implementation and AI framework

Ping Wu , Architect of Baidu APP

W3C workshop on Web Game

2019

Agenda

- 1. Introduction**
- 2. Runtime Design and Implementation**
- 3. Developer Support**
- 4. AI framework for the Smart Game**
- 5. Future work**

Introduction

1. **Baidu** - the leading Chinese language Internet search provider
2. **Baidu APP** – search and feed twin-engine powered mobile App, more than 180 million daily active users
3. **Baidu Smart Mini Program** – to take advantage of an emerging trend in China where apps with lower frequency are connecting to super apps to bypass the ever-rising cost of app pre-installs

Goals, Definitions and Challenges for Baidu Smart Game

Goals

1. Increase consumable resource type for Baidu App, set up game scenario to improve increase in DAU , user time , stickiness
2. Set up mini game ecosystem, explore distribution and monetization patterns

Definitions

1. Smart game is runnable in a browser-like environment built-up by super app, which is instant play without installation
2. A super container for forms like web game, smart mini game and cloud game
3. Include light, medium and serious game types

- Technical challenges for Smart Game
 - **Foundation layer**
 - Runtime architecture and implementation
 - **Experience layer**
 - Core user experience-high performance, low latency, high-availability
 - **Ecosystem layer**
 - Easy-to-develop, scalable game importing and rich distributable game types

Smart Game runtime design

Runtime Kernel :

- Construct a pure JS execution and native rendering environment with canvas 2D and 3D implementation.
- Provide an app model abstract for web game, like a web app package, lifecycle, version control, multi-app management.
- Provide rich native APIs in Baidu APP by JS binding framework.

JSB binding Framework- general and efficient JS-Native operation

Design principal:

- efficient
- general

Key elements:

- object model
- Life cycle
- Memory management

JSB binding framework- 10-200x improvement compared with JS bridge scheme

Loop 1000 for a simple function

```
// Javascript impl
function testTimeFunc() {
  var x = 0;
  x = x + 2 + x * 6;
}

swanNative.console.time();
for (var i = 0 ; i < 1000; i++) {
  testTimeFunc();
}
swanNative.console.timeEnd();
```

	JS	JSB JAVA/OC impementation	JSB C++/C implementation	JS bridge with scheme
iOS	1.75 ms	0.65 ms	0.197ms	2.15ms
android	1ms	0.82ms	0.05ms	NA

local data passing 1MB

```
function request(){
  swan.request({
    url: 'http://xxxxxxx',
    method: 'GET',
    responseType: 'text',
    dataType: 'json',
    success: res => {
    }
  });
}
```

	JSB text	JSB arrayBuffer	Scheme with text	Scheme with arrayBuffer
iOS	11.5ms	3.5ms	795ms	1172ms

Efficient JS execution engine

- **V8**
 - Minimize parse and compile time
 - Code Cache
 - GC Incremental marking
 - GC at each game over

initialization stage optimization by v8

Lightweight Native Rendering Engine

Design key elements:

- A lightweight standard implementation of HTML5 canvas 2D and 3D features in webGL 1.0/openGL 2.0
- Fonts render with FreeType/CoreText
- Image decoder

Key problems:

- **Context Switch**
 - Minimize context switch frequency and must-to-update switching states by diff
- **texSubImage(canvas,...)**
 - Optimize CPU data copy with CopyTexImage2D
- **Font Render**
 - Arrange memory areas based on font size

Threading model design in native rendering environment

Design key points:

- main thread for JS execution and rendering engine.
- Parallel image decoder, image IO, audio IO from render thread.

Key modules for Smart Game –file system, audio and network

sprint stage audio optimization

- **Audio**
 - Optimize cache implementation
 - JSBinding
- **File system**
 - Optimize file IO
 - JSBinding
- **Network**
 - multi-threaded download
 - Background download

Benchmark for Smart Game Runtime

Benchmark - Dashboard

```
interface _naSwan.Performance {  
    double now();  
    // 返回当前的 CPU 占用  
    float getCPU();  
    // 返回当前的进程内存  
    int getMemory();  
  
    // 注册 GC 回调函数  
    void registerGCCallback(Function);  
    /* 以下接口目前android独有 */  
    // 详细的内存信息  
    MemoryInfo getMemoryInfo();  
    // 设置、进程、线程CPU时间变化量  
    CpuUsageTime getCpuUsageTime();  
    // V8虚拟机的堆内存信息  
    HeapStatistics getV8HeapStatistics();  
    HeapSpaceStatistics getV8HeapSpaceStatistics();  
}
```

基本信息

测试游戏: 采油小怪
测试设备系统: android
应用: swan
内存大小: 0

测试开始时间: 3/29/2019, 10:38:31 PM
测试设备系统版本: Android 9
应用版本: 11.6.0.1

测试结束时间: 测试中...
测试设备机型:
CPU核心数: 0

结束测试

Smart Game Benchmark

Baidu APP scan code

Developer Support for Productivity

- 60,000 smart program developers
- 150,000 smart programs created
- 20,000 smart programs online
- 100 million DAU

Scalable large-scale game import with main stream game engines

- **Cocos** : <http://docs.cocos.com/creator/manual/zh/publish/publish-baidugame.html>
- **Egret**: <http://developer.egret.com/cn/github/egret-docs/Engine2D/minigamebaidu/getStart/index.html>
- **Laya**
- **Unity**

Super container for Cloud Game, Smart Game and Native Game

AI Framework for Baidu Smart Game

Challenges for AI enabled Smart Program and Game

- Rich and easy-to-use AI capabilities
- Same user experience as native app
- Flexible and general programmable abstraction
- Customized AI capabilities and application
- Framework for vertical industry and user scene

AI framework for Baidu Smart Program and Game

Architecture for Smart Game AR and Face

Design & Implementation rules for AR and Face

- **JS Framework** : compatible with WebXR , ARCore , ARKit API definitions, abstract developer-friendly JS object like Session , Frame, Video
- **Game runtime** : Communicate efficiently between JS and algorithm using JSB binding framework. Render the camera texture and canvas texture in the same hybrid rendering layer.
- **Algorithm**: Utilize AR ability of the system ARKit and ARCore and Baidu DuMix AR platform and Face Algo as a supplement

AR API

1. init Session : `swan.requestXRSession({ mode: 'ar' })`

异步接口，初始化成功进入 `success` 回调，失败进入 `fail` 回调

2. getFrameData : `xrSession.getFrame()`

- `getViewMatrix()`, `getProjectionMatrix()`

三维相机的变换矩阵，可以直接用于 THREE.js 等 3D 引擎

- `getPointCloud()`

特征点点云，包含点云的(x, y, z) 的三维坐标

- `getTrackablePlanes()`

获取检测到的空间中的平面

- `hitTest(x, y)`

根据屏幕像素坐标得到三维空间坐标

- `createAnchor(poseMatrix)`

创建锚点，锚点是三维空间中一个固定的位置和朝向

- `getLightEstimate()`

环境光强度

3. close Session : `xrSession.end()`

ARCore

Face API

1. Init Session : `swan.requestXRSession({ mode: 'du_face' })`

mode: 'du_face' 初始化人脸 AR 模式，未来会支持更多的模式去支持更多的 AR 场景（人体骨骼，物体追踪，图像追踪）

2. `getSessionData : xrSession.getSessionData()`

- `getCameraVideo()`

相机 Video 对象，可以直接用于 THREE.js 等引擎作为纹理数据

- `getUpdatedTrackableFaces()`

当前帧检测到的人脸

- `face.poseMatrix`

人脸姿态的 4x4 变换矩阵

- `face.landmarks`

人脸特征点归一后的 (x, y) 坐标

- `face.skeleton`

人脸骨骼节点的变换矩阵

- `face.blendShapes`

表情系数

3. close Session : `xrSession.end()`

```
cc.Class({
  onLoad() {
    swan.requestXRSession({
      mode: 'du_face',
      drawCameraBackground: false,
      success: xrSession => {
        this._cameraVideo = xrSession.getCameraVideo();
      }
    });
  },

  update() {
    this.cameraTexture.update({
      image: this._cameraVideo
    });
  }
});
```

Face Game Demo

AR Demo

WebML & Paddle.js-customize your own AI application

1. `loadModel(url | id) => Model`
2. `Model.predict(Tensor) => Tensor`
3. `createTensorFromImage(Image) => Tensor`

Future Work

1. Smart Game is a very promising web tech powered by native experience
2. Provide more building blocks, more AI enabling features, more prosperous game society

Thanks !
