# Use Case - Access a MiniApp

# Development Process

# Register a MiniApp - Generate Unique ID

MiniApp developer management system

Service market Developer Community Doc 

Home Development management Function management Version management Search access Information Flow Open Source Alliance Operations Center data analysis Promote Quickly build Member management Product Lab

## Set up

Basic Settings Development settings Association settings Third-party services

### Developer ID

| name                          | Basic Information  | management |
|-------------------------------|--|------------|
| App ID (Smart Applet ID)      | ██████████   |            |
| <b>Unique ID</b>              | 79RKhZ3 ██████████   |            |
| App Secret (Smart Applet Key) | For security reasons, AppSecret is no longer saved in clear text, please click reset if you forget the key | Show       |

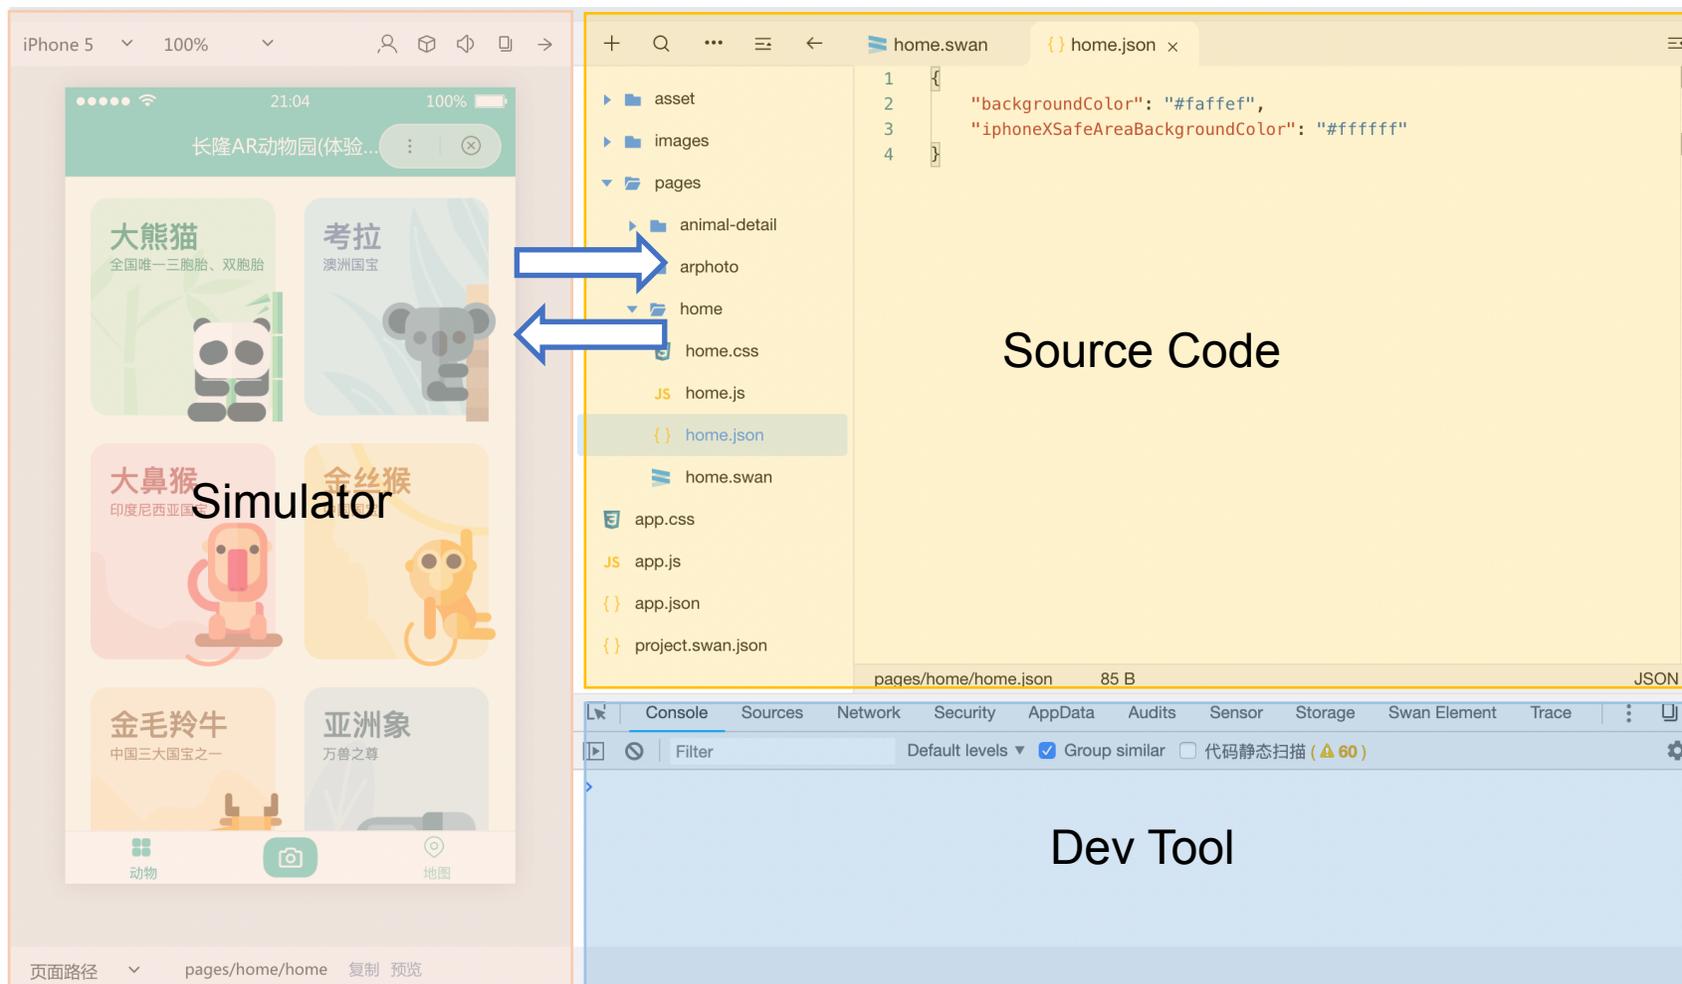

### Applet resource fetching settings

[Set up](#)

| Resource crawling settings  | Explanation   | Current status |
|-----------------------------|---|----------------|
| Applet resource grab switch | After turning on the applet resource grabber switch, Baidu will grab your web version of the applet content to help the applet get traffic in Baidu search and information flow | activated      |

  

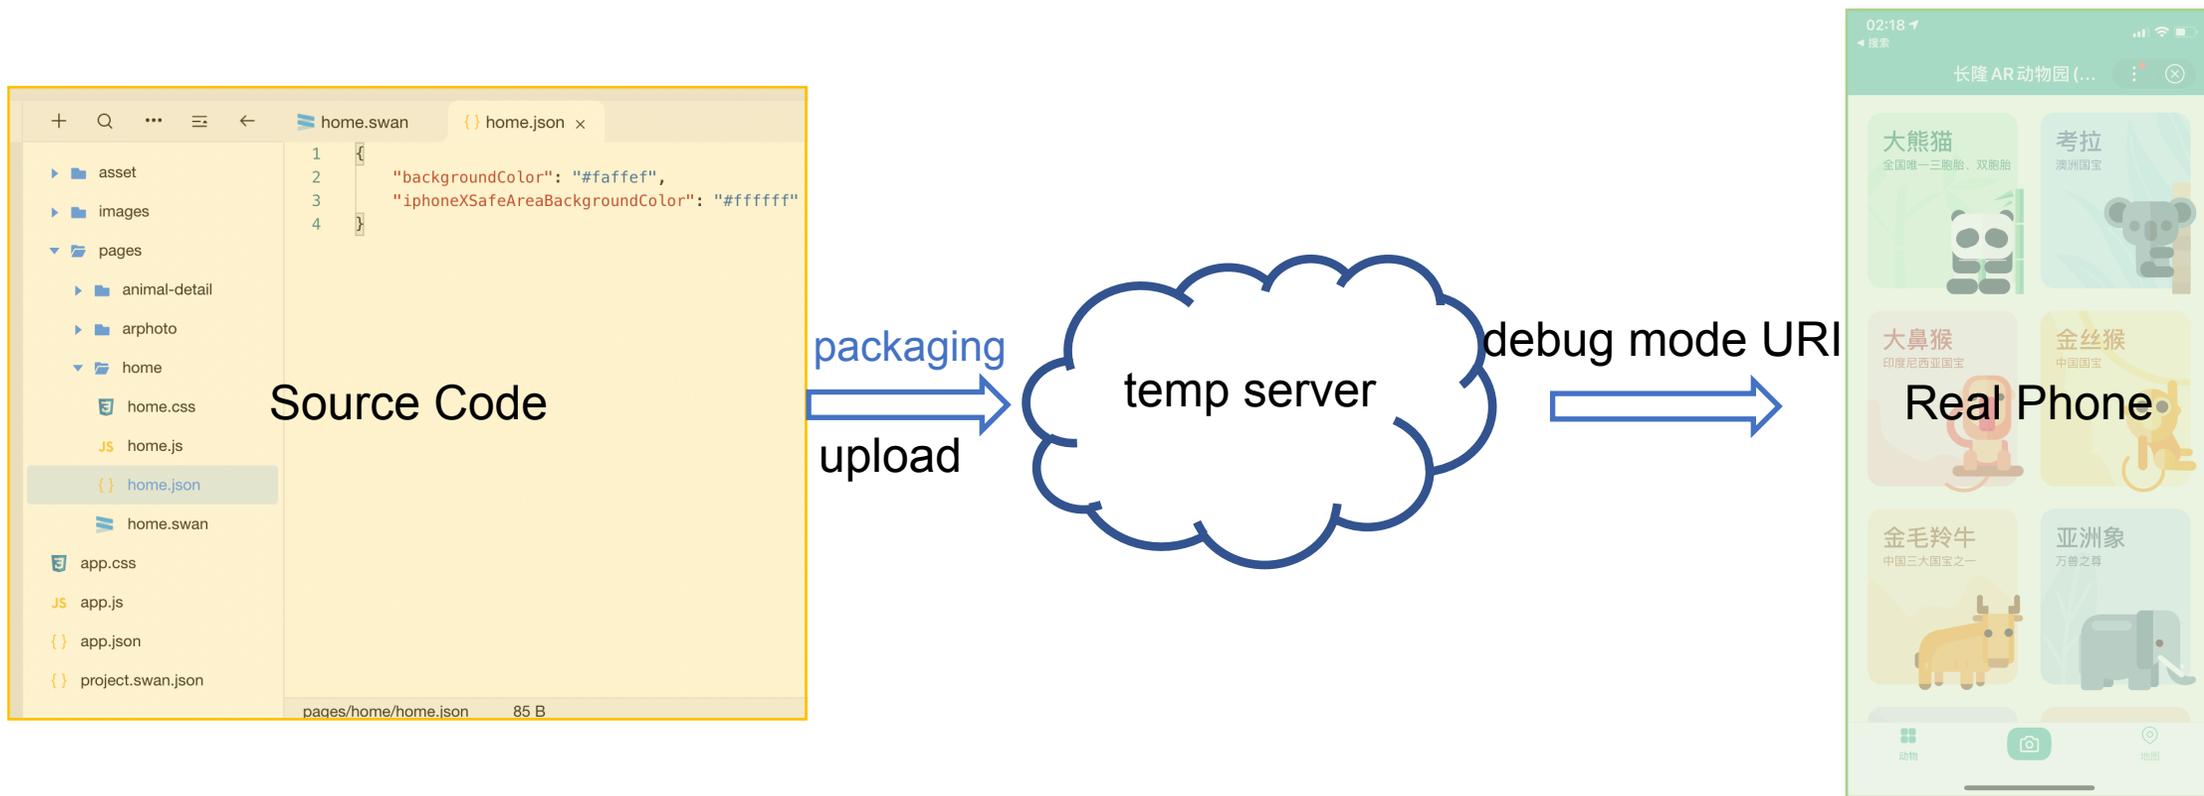

# Develop & Debug MiniApp

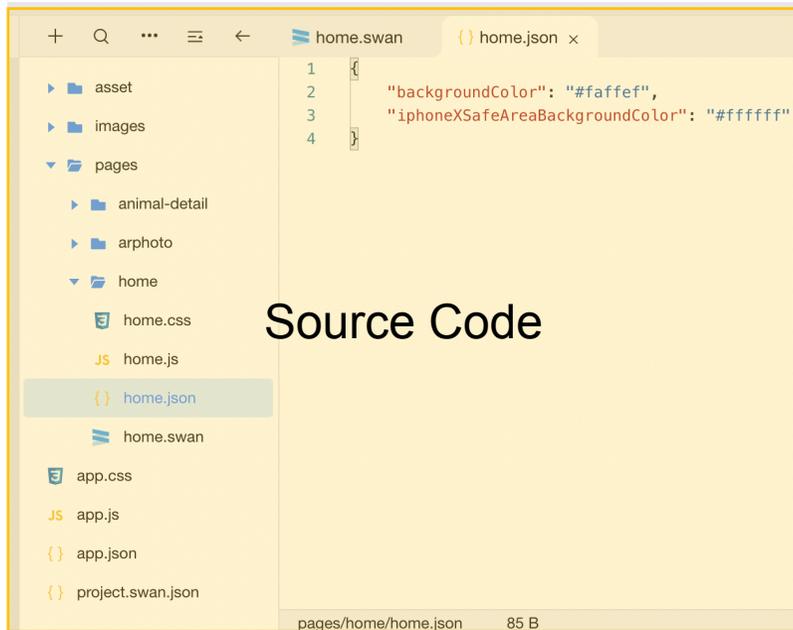

A desktop application: MiniApp IDE

# Preview MiniApp - Generate Debug URI

# Publish MiniApp - Generate Online URI

packaging  
upload

online URI

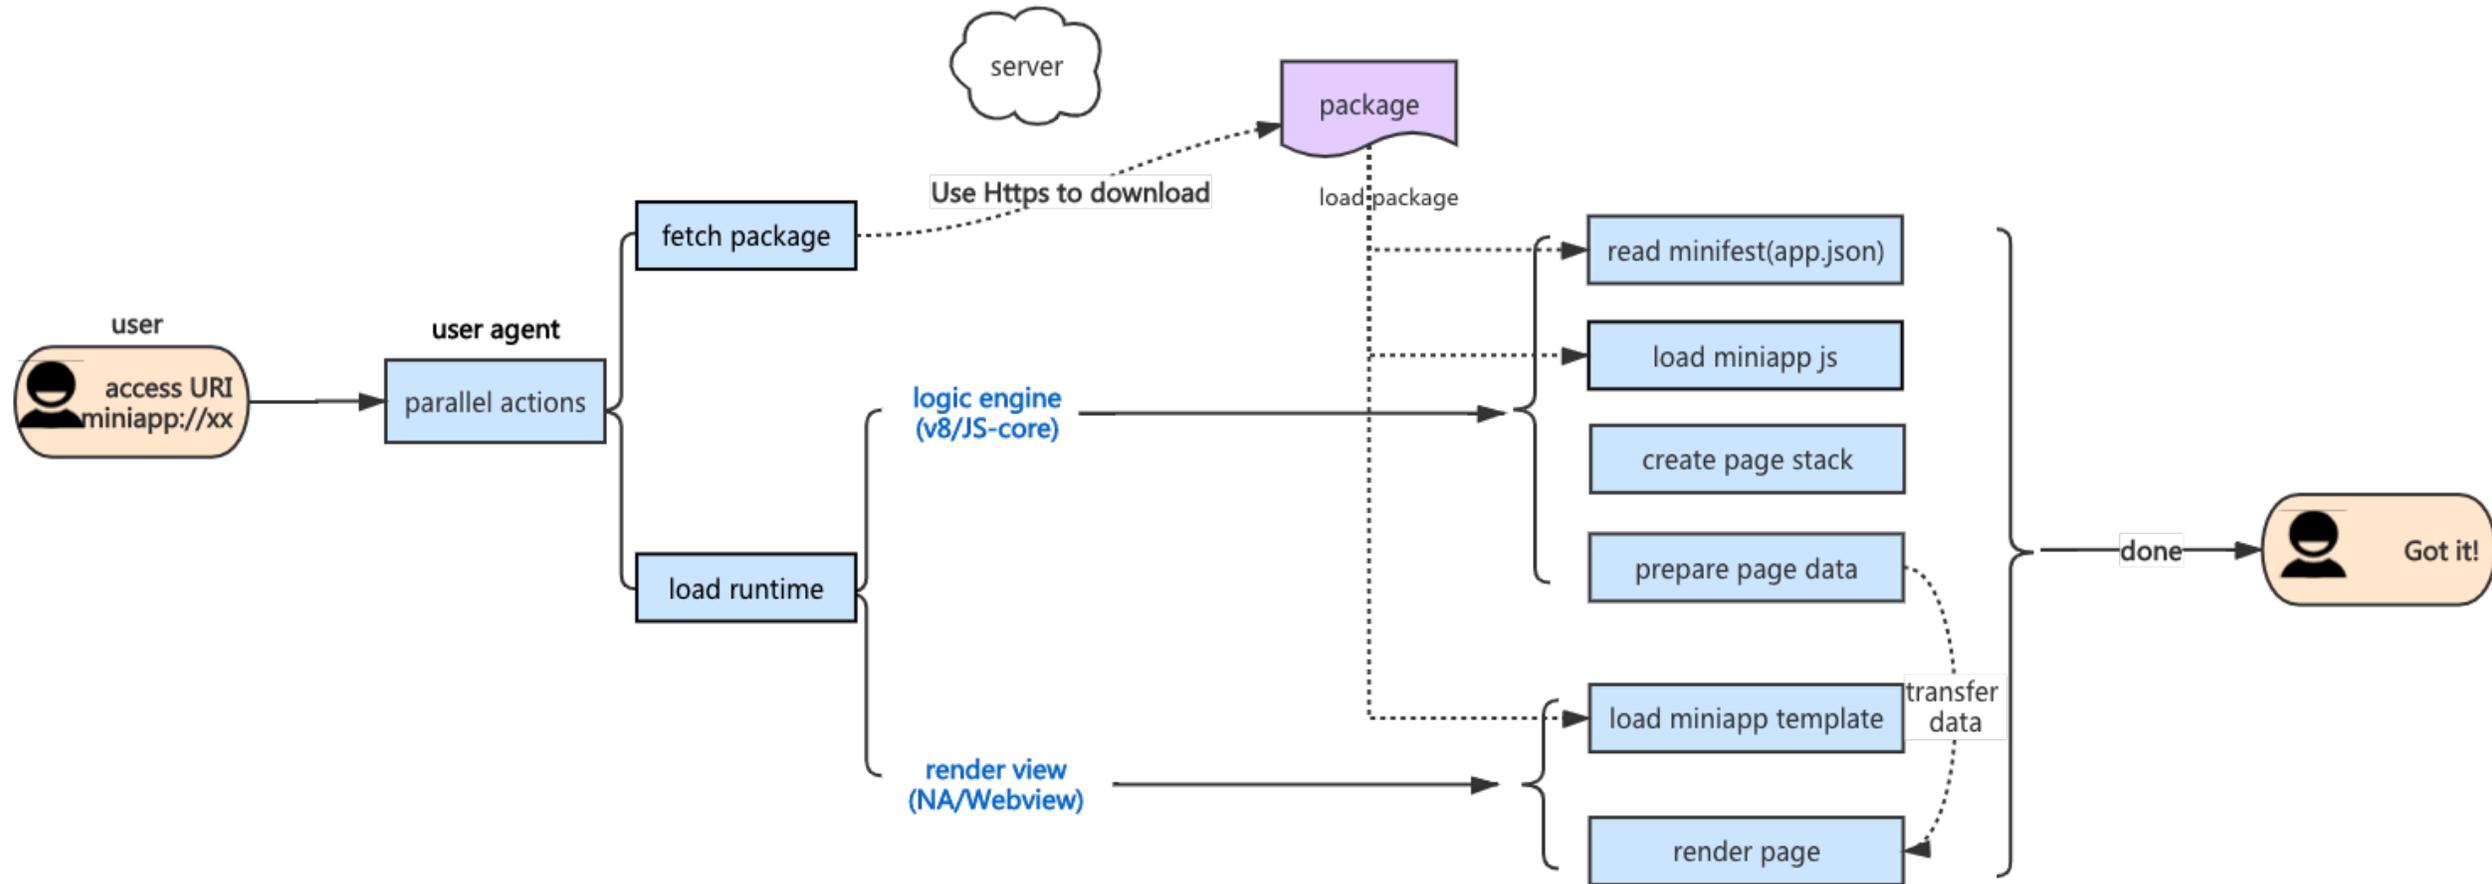

# Distribute MiniApp

- MiniApp store
- Search engine
- Smart assistant
- QR code
- Voice message
- Internet of vehicles
- Offline
- ...

# Access a URI

What is not in HTTP standards: **mark the resource type in URI(for loading runtime)**

# Current Solution of MiniApp URI

| User Agent    | URI  |
|---------------|--|
| Wechat App    | <code>weixin://dl/&lt;path&gt;/?appid=&lt;appId&gt;&amp;businessType=&lt;businessType&gt;</code> |
| Alipay App    | <code>alipays://platformapi/startapp?appid=&lt;appId&gt;&amp;url=&lt;path&gt;</code>             |
| Quick App     | <code>http://hapjs.org/app/&lt;appId&gt;/[&lt;path&gt;][?key=value]</code>                       |
|               | <code>https://hapjs.org/app/&lt;appId&gt;/[&lt;path&gt;][?key=value]</code>                      |
|               | <code>hap://app/&lt;appId&gt;/[&lt;path&gt;][?key=value]</code>                                  |
| Baidu App     | <code>baiduboxapp://swan/&lt;appId&gt;/path?[key=value]</code>                                   |
| Bytedance App | <code>sslocal://microapp?app_id=&lt;appId&gt;&amp;start_page=&lt;path&gt;</code>                 |
|               | <code>snssdk143://microapp?app_id=&lt;appId&gt;&amp;start_page=&lt;path&gt;</code>               |

# MiniApp URI Goals

- To define a general access protocol for
  - Navigation between MiniApps
  - Navigation between web page and MiniApp
  - Navigation between OS UI/ Native UI and MiniApp
- Identification of page inside MiniApp
  - Identify the package: id, version, package address
  - Identify the resource inside package: page path, query and fragment

# URI Syntax Design Process

## phase1

Q: Is it possible to use the address of downloading packages as the URI of MiniApp? Just like “https://smartapps.cn/getpkg?appKey=123&path=%2Fanimal”

A: No. The user agent need to identify whether it is a MiniApp request or not. The protocol header identification(miniapp://) will be used in pre-loading the miniapp runtime environment.

e.g., miniapp://smartapp.cn?appId=123&path=%2Fanimal

## phase2

Q: As a user agent, I want more flexibility and don't want to be restricted that how and where to fetch packages

A: Yes. The name of the domain can be omitted. The only required content is the id.

e.g., miniapp://123

## phase3

Q: But what if the user agent wants to specify the domain name?

A: Ok, the domain name is still a part of the authority. Like ‘miniapp://<appId>@host:port’. Yes, it looks like id replaced username.

e.g., miniapp://123@smartapp.cn

[For more information, see MiniApp URI FAQ](#)

# URI Syntax Design Process

## phase4

Q: Every time when the miniapp was published, it has a version number. Where is it?

A: The id is used to identify miniapps. The version number meanwhile decided which specific package was requested. It has the same status as the id number.

e.g., `miniapp://foo;version=1.0.1@example.com`

## phase5

Q: Where should the path of miniapp be placed?

A: It makes more sense that the path of miniapp located in the path part of URI. And it will make a good separation between the query of miniapp page query.

e.g., `miniapp://foo;version=1.0.1@example.com/pages/index`

## phase6

Q: Then how about the query of miniapp's page?

A: As mentioned above, all key info was settled down. The query of miniapp page will be placed in the query part in URI. It comes as same as the fragment part.

## conclusion

`miniapp://foo;version=1.0.1@example.com/pages/index?category=book#section-3`

# Syntax Design

```
miniappuri = scheme "://" authority path-abempty [ "?" query ] [ "#" fragment ]  
scheme = "miniapp"  
authority = id [ ";version=" version ] [ "@" host [ ":" port ] ]  
id = 1*unreserved  
version = *unreserved
```

# Key Scenarios

## Scenario 1: A link to a MiniApp page in HTML

```
<!doctype html> <html> <a href="miniapp://foo;version=1.0.1-trial@example.com:8080/pages/index?category=book#section-3">open a MiniApp</a> </html>
```

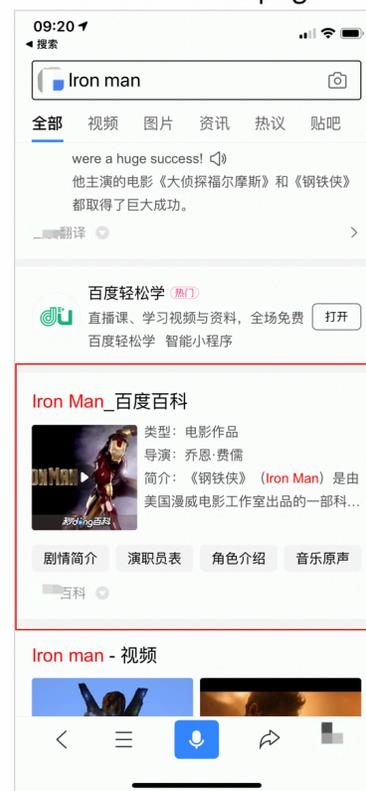

## Scenario 2: A link to a MiniApp page in JavaScript

```
location.href = "miniapp://foo;version=1.0.1-trial@example.com:8080/pages/index?category=book#section-3"
```

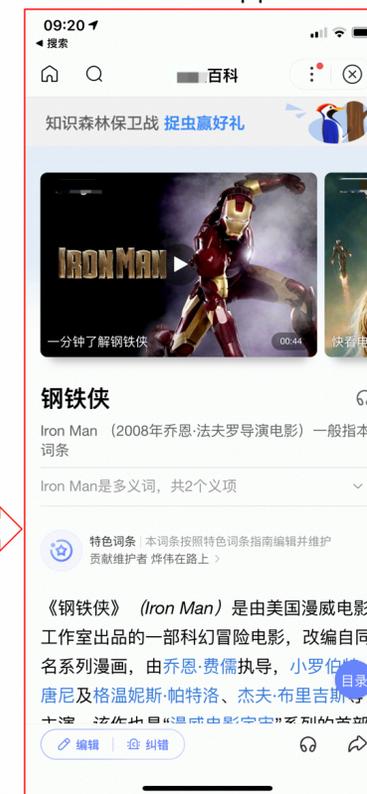

## Scenario 3: use a MiniApp URI

```
console.log(location.href); // miniapp://foo;version=1.0.1-trial@example.com:8080/pages/index?k=v#bar
console.log(location.protocol); // miniapp:
console.log(location.origin); // miniapp://foo;version=1.0.1-trial@example.com:8080
console.log(location.id); // foo
console.log(location.version); // 1.0.1-trial
console.log(location.host); // example.com
console.log(location.port); // 8080
console.log(location.pathname); // /pages/index
console.log(location.search); // ?k=v
console.log(location.hash); // #bar
```

a link in Web page

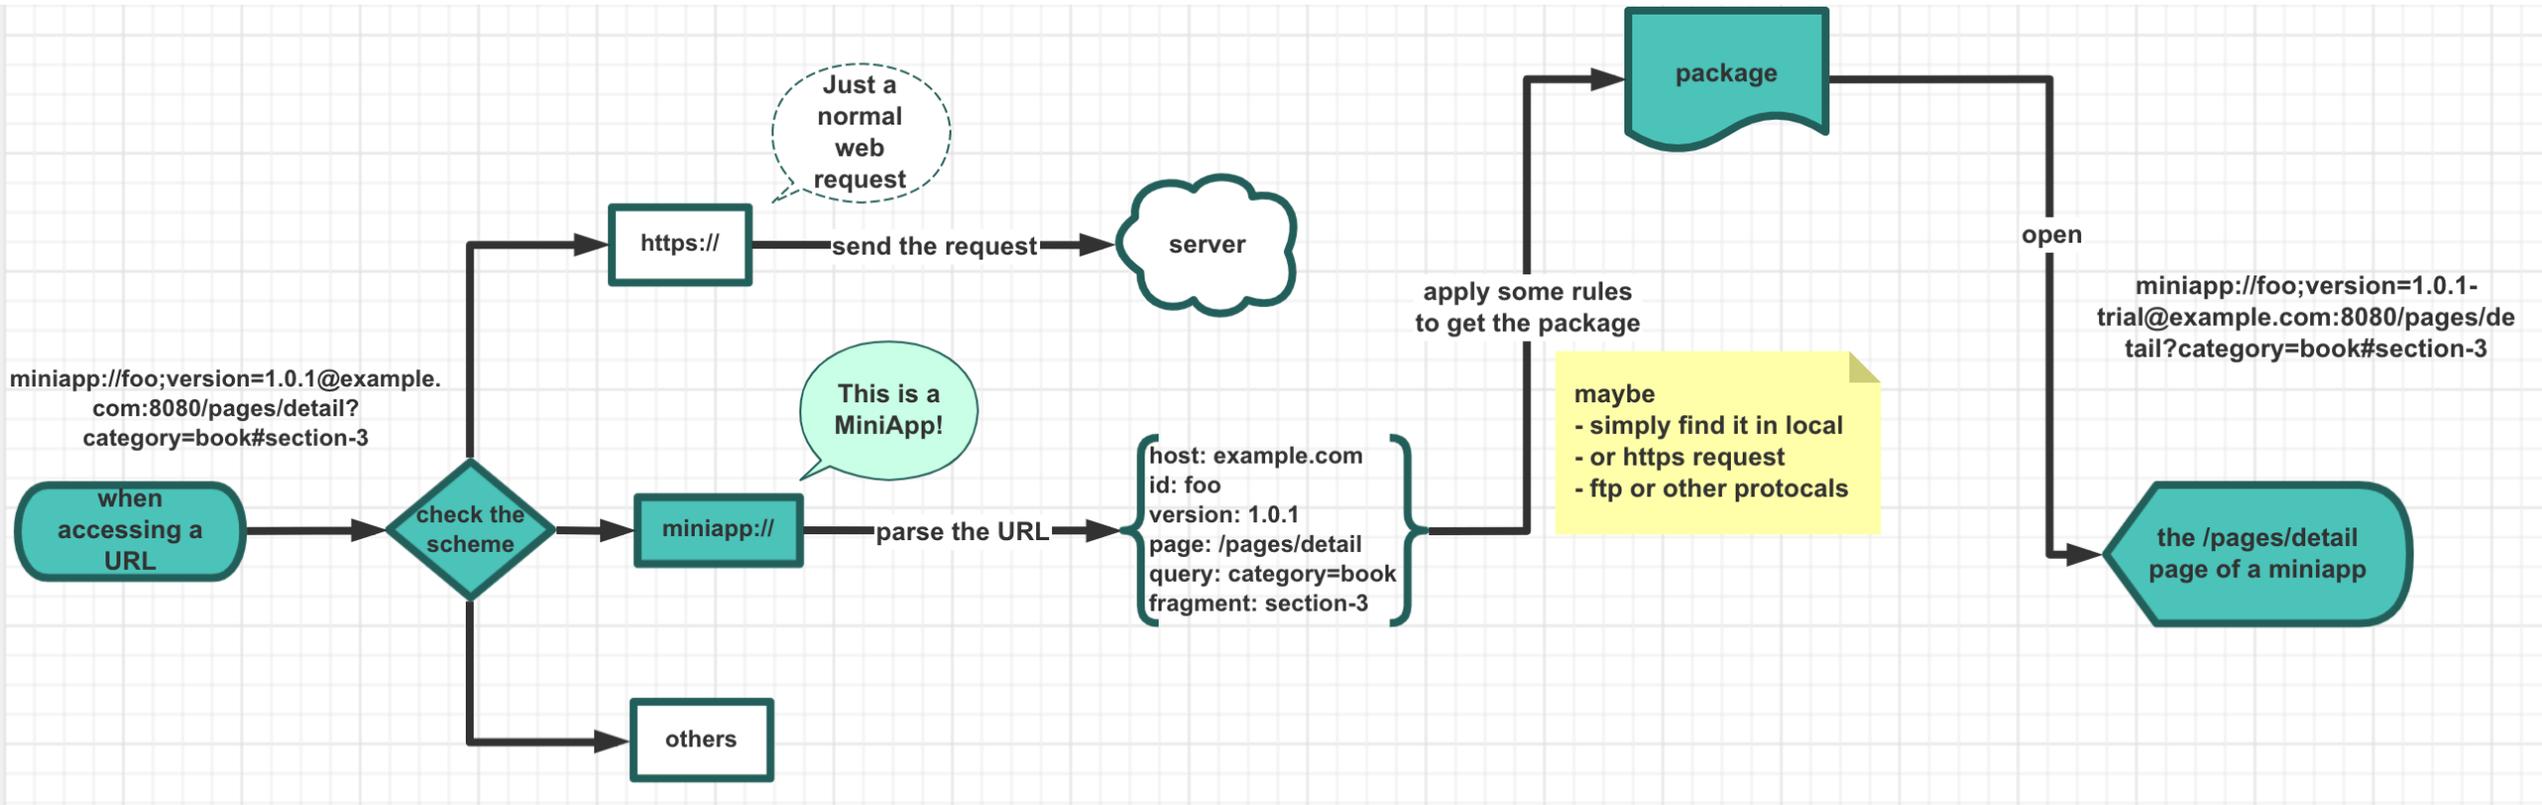

a MiniApp

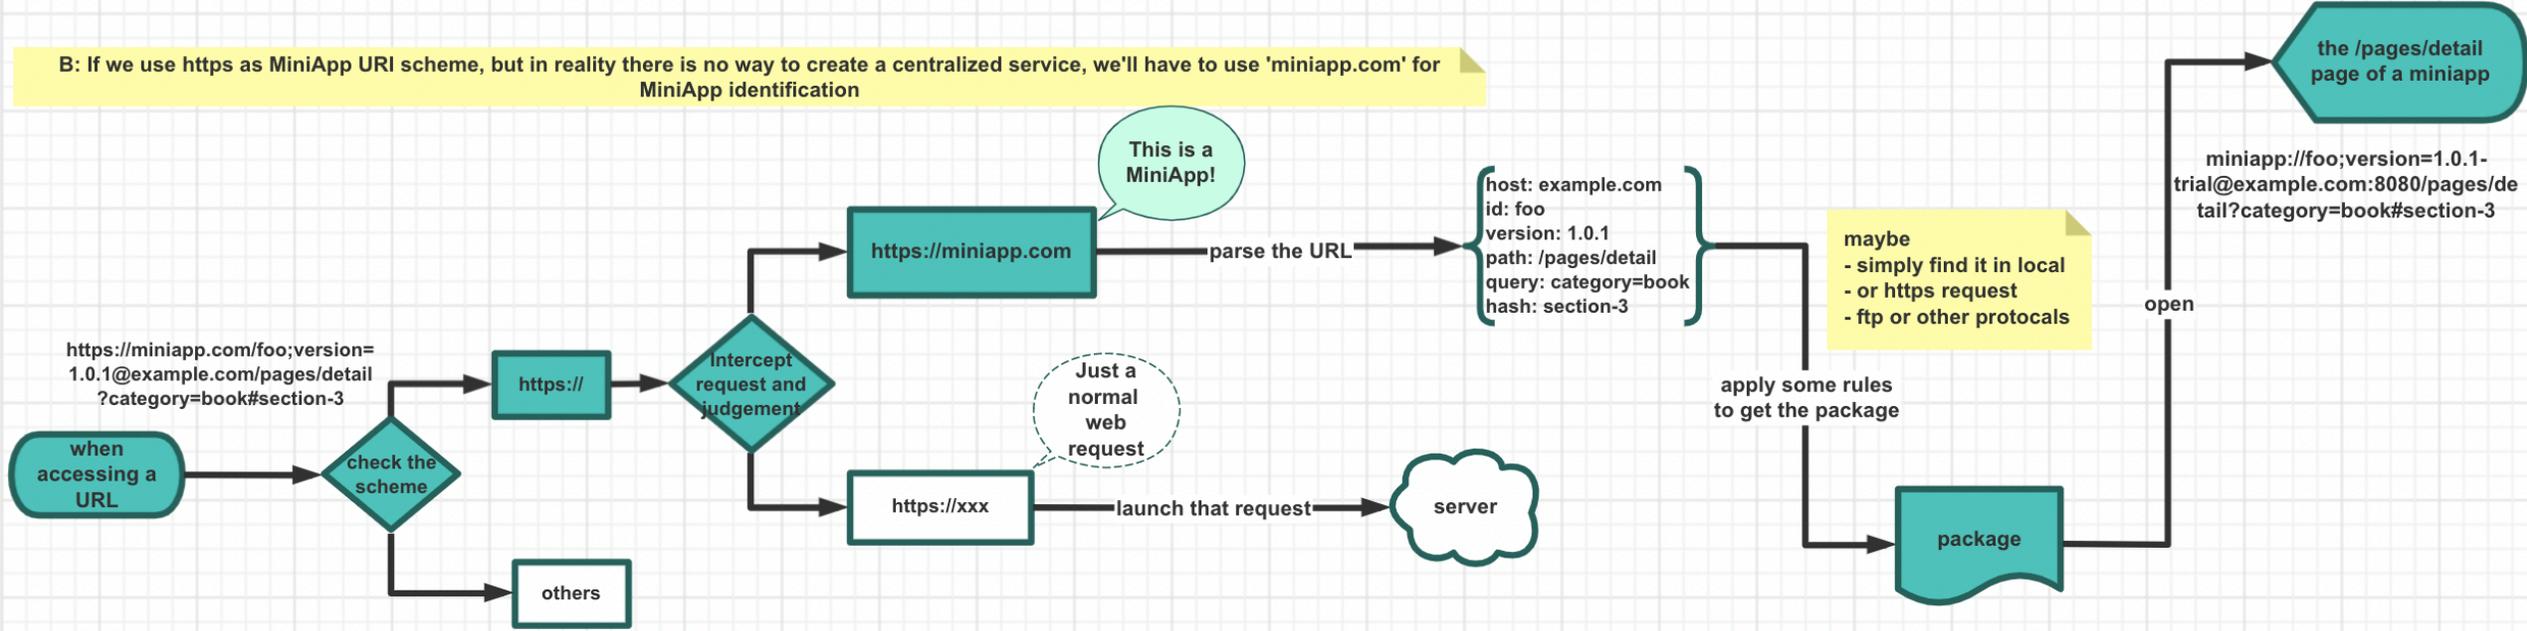

# Dereferencing

The dereferencing process of MiniApp URI scheme:

# More Possibilities

B: If we use https as MiniApp URI scheme, but in reality there is no way to create a centralized service, we'll have to use 'miniapp.com' for MiniApp identification

**Advantages:**

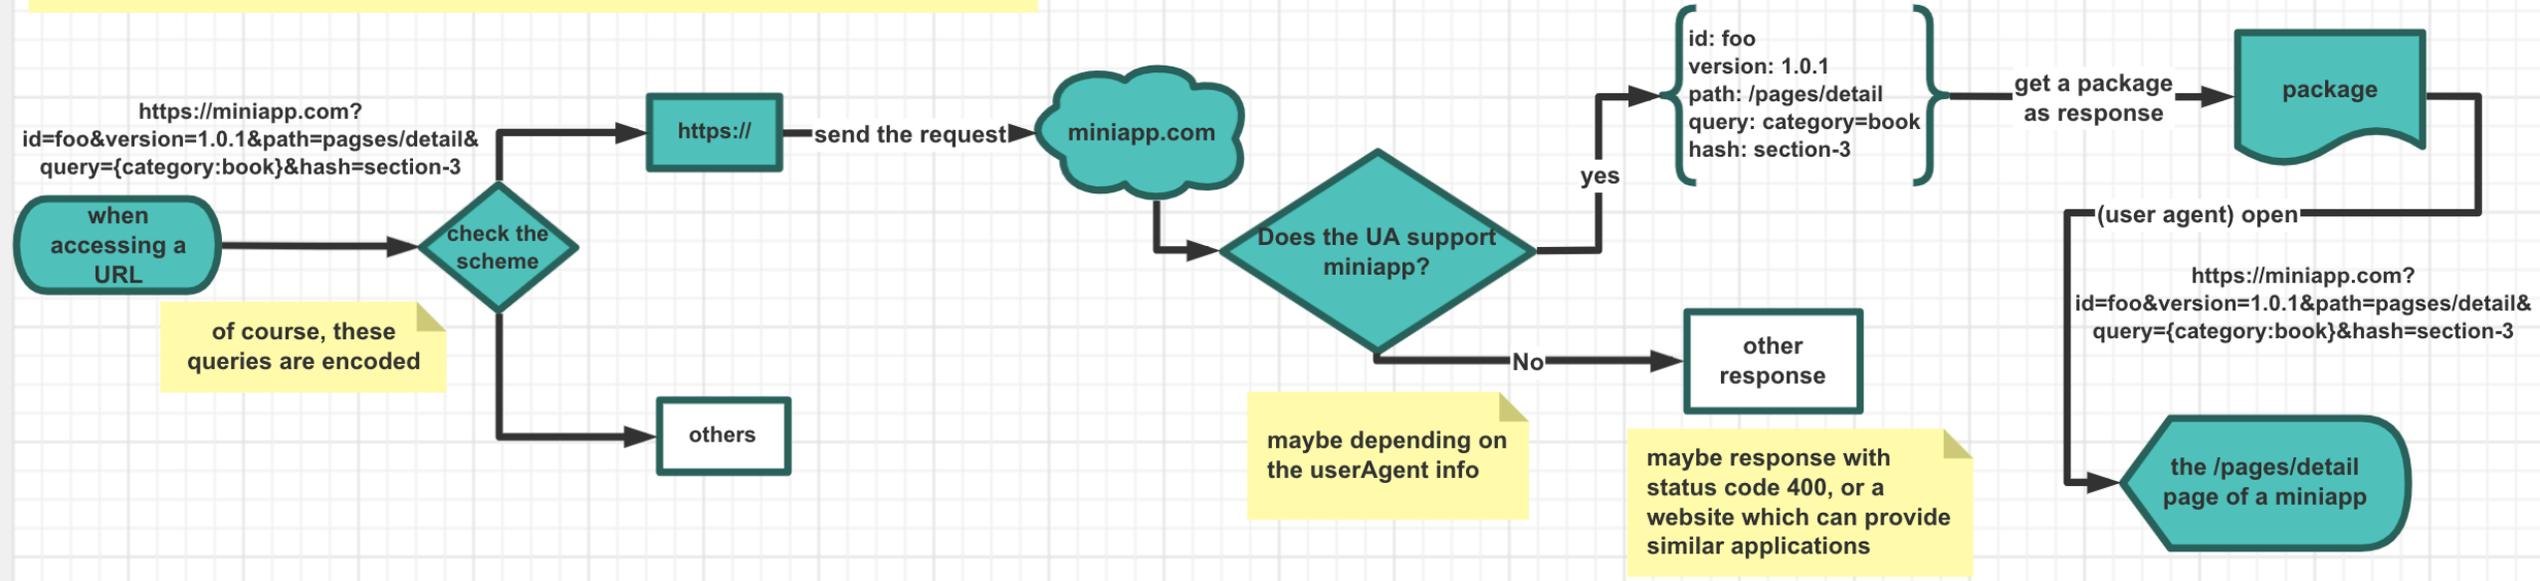

Don't need to create a new scheme

**Disadvantages:**

1. The checking process is more redundant
2. May violates the semantics of http

# More Possibilities

C: If we can have a centralized service, everything will be easy, but who will take over the role as the maintainer?

**Advantages:**

Don't need to create a new URI syntax

**Disadvantages:**

1. Lack of anticipation for preparing runtime environment
2. Depends on a centralized service
3. Restrict the method to get package

# Longer-Term Vision for MiniApp?

- Hear global feedback and go international
- MiniApp can run across platforms, hosts, and browsers without difference.
- MiniApp can have centralized management and ‘miniapp://id’ can uniquely identify a MiniApp in the world.

**Thank you!**
