Secure Remote Commerce +
Payment Pointers

Payment pointers

fynbos.

- Account holders are **issued payment pointers** by their bank or digital wallet.
e.g. \$wallet.com/alice.cooper
- The format is **easy to recognise** and **remember** but is really just a URL.
e.g. https://wallet.com/alice.cooper
- The URL is an entrypoint to APIs for data exchange, payment initiation, etc
- Customers can host their own payment pointers that redirect to the bank.
e.g. https://robshardware.com/pay redirects to https://wallet.com/robshardware
- Payment pointers can also be created for individual payments for easy sharing (e.g. via a QR code) and reconciliation to invoices or purchase orders.

Payment pointers use content negotiation

fynbos.

The same URL can return a Web page or an API

`https://wallet.com/robshardware/`
Accept: application/json

```
{  
  'accountHolder': 'Robs...'  
  'accountType': 'Current'  
  ...  
}
```

Wallet

`https://wallet.com/robshardware/`
Accept: text/html

WH Rob's Hardware	
USD account ending in 0789	
<hr/>	
Summary	Account holder name
USD account ending in 0789	Rob's Hardware LLC
Nickname	ACH Routing number
Add a nickname	254070116
Account number	Account type
37400789	Checking

Grant Negotiation and Authorization Protocol fynbos.

- Used to handle authorization for access to Open Payments APIs
- Successor to OAuth 2.0
- Extensible user interaction mechanisms
 - Web Redirect
 - App Redirect
 - Short code
 - Secure Payment Confirmation (via extension)
- **Grants** offer more granular **authorizations** than scopes

Status: Core spec currently at WG last call within IETF

Next Steps

fynbos.

- Fynbos are working with partners to issue single-use or tokenized cards to share via Open Payments APIs with acquirer.
- Open Payment APIs being documented as formal specification and updated to support multiple payment methods (cards, ACH, SEPAInst etc).
- Complete new Internet Draft to define how SPC can be used with GNAP as an interaction mode.
