Abstract

This specification defines the Document Object Model Validation Level 3, a platform- and language-neutral interface. This module provides the guidance to programs and scripts to dynamically update the content and the structure of documents while ensuring that the document remains valid, or to ensure that the document becomes valid.

Status of this document

This section describes the status of this document at the time of its publication. Other documents may supersede this document. The latest status of this document series is maintained at the W3C.

This is the Candidate Recommendation specification of "DOM Level 3 Validation". This version is based on the feedback during the Last Call period. The DOM Working Group expects to request that the Director advance this specification to Proposed Recommendation after the DOM Working Group documents two interoperable implementations of at least one normative binding. Basic tests of features of this specification will be produced and used in this effort. The two implementations must be produced by different organizations. The estimated end of the Candidate Recommendation period is 31 August 2003. Comments on this document are invited and are to be sent to the public mailing list www-dom@w3.org, before the end of the review period. An archive is available at <http://lists.w3.org/Archives/Public/www-dom/>.

Individuals or organizations are also invited to send a message to the public mailing list if they intend to produce an implementation of this module. The implementation report is also available.

This is a draft document and may be updated, replaced or obsoleted by other documents at any time. It is inappropriate to use W3C Working Drafts as reference material or to cite them as other than "work in progress". This is work in progress and does not imply endorsement by, or the consensus of, either W3C or participants of the DOM working group.

This document has been produced as part of the W3C DOM Activity. The authors of this document are the DOM Working Group participants.

Patent disclosures relevant to this specification may be found on the Working Group's patent disclosure page.

A list of current W3C Recommendations and other technical documents can be found at <http://www.w3.org/TR>.

W3C Copyright Notices and Licenses

Copyright © 2003 World Wide Web Consortium, (Massachusetts Institute of Technology, European Research Consortium for Informatics and Mathematics, Keio University). All Rights Reserved.

This document is published under the W3C® Document Copyright Notice and License [p.5] . The bindings within this document are published under the W3C® Software Copyright Notice and License [p.6] . The software license requires "Notice of any changes or modifications to the W3C files, including the date changes were made." Consequently, modified versions of the DOM bindings must document that they do not conform to the W3C standard; in the case of the IDL definitions, the pragma prefix can no longer be 'w3c.org'; in the case of the Java language binding, the package names can no longer be in the 'org.w3c' package.

1. Validation

Editors:

Ben Chang, Oracle
 Joe Kesselman, IBM (until September 2001)
 Rezaur Rahman, Intel Corporation (until July 2001)

1.1 Overview

This chapter describes the optional DOM Level 3 Validation feature. This module provides APIs to guide construction and editing of XML documents. Examples of such guided editing are queries of the nature that combine questions like "what does the schema allow me to insert/delete here?" and "if I insert/delete here, will the document still be valid?".

Users may also want to know several levels of details, e.g., all the possible children, those which would be valid given what precedes this point, lists of defined symbols of a given kind, in order to help in editing and creating an XML document. Some of these queries would prompt checks and warn you if you're about to conflict with or overwrite such data.

Finally, users would like to validate an edited or newly constructed document before serializing it or passing it to other users. To some, they may edit, come up with an invalid document, then edit again to result in a valid document. During this process, these APIs can allow the user to check the validity of the document or sub-tree on demand; and if needed can also require that the document or sub-tree remain valid during this editing process via the `DocumentEditVAL.continuousValidityChecking` [p.10] flag.

A DOM application can use the `hasFeature(feature, version)` method of the `DOMImplementation` interface to determine with parameter values "Validation" and "3.0", respectively, whether or not these interfaces are supported by the implementation. In order to fully support this feature, an implementation must also support the "Core" feature defined in [DOM Level 2 Core] or newer. The requirements for conformance to a DOM Level 3 module is defined in the *conformance* section of [DOM Level 3 Core].

This chapter focuses on the editing aspects used in the XML document editing world and usage of such information. The appendix describes in detail all the possible outcomes of the validation operations on the different node types.

1.2 Exceptions

This section describes the "VAL-DOC-EDIT" exceptions.

Exception *ExceptionVAL*

Some Validation operations may throw an `ExceptionVAL` [p.9] as described in their descriptions.

IDL Definition

```
exception ExceptionVAL {
    unsigned short code;
};

// ExceptionVALCode
const unsigned short NO_SCHEMA_AVAILABLE_ERR = 71;
```

Definition group *ExceptionVALCode*

An integer indicating the type of error generated.

Defined Constants

NO_SCHEMA_AVAILABLE_ERR

This error occurs when the operation cannot complete due to an unavailable schema [p.41].

1.3 Document Editing Interfaces

This section contains "Document Editing" methods as described in the *DocumentEditVAL* [p.10], *NodeEditVAL* [p.11], *ElementEditVAL* [p.14], and *CharacterDataEditVAL* [p.19] interfaces.

Interface *DocumentEditVAL*

This interface extends the *NodeEditVAL* [p.11] interface with additional methods for document editing. An object implementing this interface must also implement the *Document* interface.

IDL Definition

```
interface DocumentEditVAL : NodeEditVAL {
    attribute boolean continuousValidityChecking;
        // raises(DOMException,
        //        ExceptionVAL,
        //        DOMException) on setting

    readonly attribute DOMConfiguration config;
    NameList getDefinedElements(in DOMString namespaceURI);
    unsigned short validateDocument();
};
```

Attributes

config of type *DOMConfiguration*, readonly

This allows the setting of the error handler, as described in the [DOM Level 3 Core] *DOMConfiguration* interface.

continuousValidityChecking of type *boolean*

An attribute specifying whether the validity of the document is continuously enforced.

When the attribute is set to *true*, the implementation may raise certain exceptions, depending on the situation (see the following). This attribute is *false* by default.

Exceptions on setting

DOMException	NOT_SUPPORTED_ERR: Raised if the implementation does not support setting this attribute to true.
ExceptionVAL [p.9]	NO_SCHEMA_AVAILABLE_ERR: Raised if this attribute is set to true and a schema is unavailable.
DOMException	VALIDATION_ERR: Raised if an operation makes this document not compliant with the VAL_INCOMPLETE validity type or the document is invalid, and this attribute is set to true.

Methods

getDefinedElements

Returns list of all element information item names of global declaration [p.41] , belonging to the specified namespace.

Parameters

namespaceURI of type DOMString

namespaceURI of namespace. For DTDs, this is null.

Return Value

NameList List of all element information item names belonging to the specified namespace or null if no schema is available.

No Exceptions

validateDocument

Validates the document against the schema, e.g., a DTD or an XML Schema or another. Any attempt to modify any part of the document while validating results in implementation-dependent behavior. In addition, the validation operation itself cannot modify the document, e.g., for default attributes. This method makes use of the error handler, as described in the [DOM Level 3 Core] DOMConfiguration interface, with all errors being SEVERITY_ERROR as defined in the DOMError interface.

Return Value

unsigned short A validation state constant.

No Parameters

No Exceptions

Interface *NodeEditVAL*

This interface is similar to the [DOM Level 3 Core] Node interface, with methods for guided document editing.

IDL Definition

```
interface NodeEditVAL {
    // validationType
    const unsigned short      VAL_WF           = 1;
    const unsigned short      VAL_NS_WF         = 2;
```

```

const unsigned short      VAL_INCOMPLETE          = 3;
const unsigned short      VAL_SCHEMA              = 4;

// validationState
const unsigned short      VAL_TRUE                = 5;
const unsigned short      VAL_FALSE               = 6;
const unsigned short      VAL_UNKNOWN             = 7;

readonly attribute DOMString      defaultValue;
readonly attribute DOMStringList   enumeratedValues;
unsigned short            canInsertBefore(in Node newChild,
                                         in Node refChild);
unsigned short            canRemoveChild(in Node oldChild);
unsigned short            canReplaceChild(in Node newChild,
                                         in Node oldChild);
unsigned short            canAppendChild(in Node newChild);
unsigned short            nodeValidity(in unsigned short valType);
};

}

```

Definition group *validationType*

An integer indicating the validation type. Other specifications can define stricter validation types/constants by extending the `NodeEditVAL` interface.

Defined Constants

`VAL_INCOMPLETE`

Check if the node's immediate children are those expected by the content model. This node's trailing required children could be missing. It includes `VAL_NS_WF`.

`VAL_NS_WF`

Check if the node is namespace well-formed [p.41].

`VAL_SCHEMA`

Check if the node's entire subtree are those expected by the content model. It includes `VAL_NS_WF`.

`VAL_WF`

Check if the node is well-formed [p.41].

Definition group *validationState*

An integer indicating the validation state, or whether the operation can or cannot be done.

Defined Constants

`VAL_FALSE`

False if the node is invalid with regards to the operation, or if the operation cannot be done.

`VAL_TRUE`

True if the node is valid with regards to the operation, or if the operation can be done.

`VAL_UNKNOWN`

The validity of the node is unknown.

Attributes

`defaultValue` of type `DOMString`, readonly

The default value specified in an attribute or an element declaration or `null` if unspecified. If the schema is an XML Schema, this is the canonical lexical representation of the default value.

`enumeratedValues` of type `DOMStringList`, readonly

A `DOMStringList`, as described in [DOM Level 3 Core], of distinct values for an attribute or an element declaration or `null` if unspecified. If the schema is an XML Schema, this is a list of strings which are lexical representations corresponding to the values in the `[value]` property of the enumeration component for the type of the attribute or element. It is recommended that the canonical lexical representations of the values be used.

Methods

`canAppendChild`

Determines whether the `Node.appendChild` operation would make this document not compliant with the `VAL_INCOMPLETE` validity type.

Parameters

`newChild` of type `Node`

Node to be appended.

Return Value

`unsigned short` A validation state constant.

No Exceptions

`canInsertBefore`

Determines whether the `Node.insertBefore` operation would make this document not compliant with the `VAL_INCOMPLETE` validity type.

Parameters

`newChild` of type `Node`

Node to be inserted.

`refChild` of type `Node`

Reference Node.

Return Value

`unsigned short` A validation state constant.

No Exceptions

`canRemoveChild`

Determines whether the `Node.removeChild` operation would make this document not compliant with the `VAL_INCOMPLETE` validity type.

Parameters

`oldChild` of type `Node`

Node to be removed.

Return Value

`unsigned short` A validation state constant.

No Exceptions

`canReplaceChild`

Determines whether the `Node.replaceChild` operation would make this document not compliant with the `VAL_INCOMPLETE` validity type.

Parameters

`newChild` of type `Node`

 New Node.

`oldChild` of type `Node`

 Node to be replaced.

Return Value

`unsigned short` A validation state constant.

No Exceptions

`nodeValidity`

Determines if the node is valid relative to the validation type specified in `valType`. This operation doesn't normalize before checking if it is valid. To do so, one would need to explicitly call a normalize method. The difference between this method and the `DocumentEditVAL.validateDocument()` [p.11] method is that the latter method only checks to determine whether the entire document is valid.

Parameters

`valType` of type `unsigned short`

Flag to indicate the validation type checking to be done.

Return Value

`unsigned short` A validation state constant.

No Exceptions

Interface *ElementEditVAL*

This interface extends the `NodeEditVAL` [p.11] interface with additional methods for guided document editing. An object implementing this interface must also implement the `Element` interface.

This interface also has attributes that are a `NameList` of elements or attributes which can appear in the specified context. Some schema languages, i.e., *XML Schema*, define wildcards which provide for validation of attribute and element information items dependent on their namespace names but independent of their local names.

To expose wildcards, the `NameList` returns the values that represent the *namespace constraint*:

- `{namespaceURI, name}` is `{null, ##any}` if *any*;
- `{namespaceURI, name}` is `{namespace_a, ##other}` if *not and a namespace name (namespace_a)*;
- `{namespaceURI, name}` is `{null, ##other}` if *not and absent*;
- Pairs of `{namespaceURI, name}` with values `{a_namespaceURI | null, null}` if *a set whose members are either namespace names or absent*.

IDL Definition

```

interface ElementEditVAL : NodeEditVAL {

    // ContentTypeVAL
    const unsigned short      VAL_EMPTY_CONTENTTYPE      = 1;
    const unsigned short      VAL_ANY_CONTENTTYPE        = 2;
    const unsigned short      VAL_MIXED_CONTENTTYPE      = 3;
    const unsigned short      VAL_ELEMENTS_CONTENTTYPE   = 4;
    const unsigned short      VAL_SIMPLE_CONTENTTYPE     = 5;

    readonly attribute NameList      allowedChildren;
    readonly attribute NameList      allowedFirstChildren;
    readonly attribute NameList      allowedParents;
    readonly attribute NameList      allowedNextSiblings;
    readonly attribute NameList      allowedPreviousSiblings;
    readonly attribute NameList      allowedAttributes;
    readonly attribute NameList      requiredAttributes;
    readonly attribute unsigned short contentType;
    unsigned short                canSetTextContent(in DOMString possibleTextContent);
    unsigned short                canSetAttribute(in DOMString attrname,
                                                    in DOMString attrval);
    unsigned short                canSetAttributeNode(in Attr attrNode);
    unsigned short                canSetAttributeNS(in DOMString namespaceURI,
                                                    in DOMString qualifiedName,
                                                    in DOMString value);
    unsigned short                canRemoveAttribute(in DOMString attrname);
    unsigned short                canRemoveAttributeNode(in Node attrNode);
    unsigned short                canRemoveAttributeNS(in DOMString namespaceURI,
                                                    in DOMString localName);
    unsigned short                isElementDefined(in DOMString name);
    unsigned short                isElementDefinedNS(in DOMString namespaceURI,
                                                    in DOMString name);
};

}

```

Definition group *ContentTypeVAL*

An integer indicating the content type of an element.

Defined Constants

VAL_ANY_CONTENTTYPE

The content model contains unordered child information item(s), i.e., element, processing instruction, unexpanded entity reference, character, and comment information items as defined in the [XML Information set]. If the schema is a DTD, this corresponds to the ANY content model.

VAL_ELEMENTS_CONTENTTYPE

The content model contains a sequence of *element information items* optionally separated by whitespace. If the schema is a DTD, this is the element content content model; and if the schema is an XML Schema, this is the element-only content type.

VAL_EMPTY_CONTENTTYPE

The content model does not allow any *content*. If the schema is an XML Schema, this corresponds to the empty content type; and if the schema is a DTD, this corresponds to the EMPTY content model.

VAL_MIXED_CONTENTTYPE

The content model contains a sequence of ordered *element information items* optionally interspersed with character data. If the schema is an XML Schema, this corresponds to the `mixed` content type.

VAL_SIMPLE_CONTENTTYPE

The content model contains *character information items*. If the schema is an XML Schema, then the element has a content type of `VAL_SIMPLE_CONTENTTYPE` if the type of the element is a `simple type definition`, or the type of the element is a `complexType` whose `{content type}` is a `simple type definition`.

Attributes**allowedAttributes** of type `NameList`, readonly

A `NameList`, as described in [DOM Level 3 Core], of all possible attribute information items or wildcards that can appear as attributes of this element, or `null` if this element has no context or schema. Duplicate pairs of `{namespaceURI, name}` are eliminated.

allowedChildren of type `NameList`, readonly

A `NameList`, as described in [DOM Level 3 Core], of all possible element information items or wildcards that can appear as children of this element, or `null` if this element has no context or schema. Duplicate pairs of `{namespaceURI, name}` are eliminated.

allowedFirstChildren of type `NameList`, readonly

A `NameList`, as described in [DOM Level 3 Core], of all possible element information items or wildcards that can appear as a first child of this element, or `null` if this element has no context or schema. Duplicate pairs of `{namespaceURI, name}` are eliminated.

allowedNextSiblings of type `NameList`, readonly

A `NameList`, as described in [DOM Level 3 Core], of all possible element information items or wildcards that can appear as a next sibling of this element, or `null` if this element has no context or schema. Duplicate pairs of `{namespaceURI, name}` are eliminated.

allowedParents of type `NameList`, readonly

A `NameList`, as described in [DOM Level 3 Core], of all possible element information items that can appear as a parent this element, or `null` if this element has no context or schema.

allowedPreviousSiblings of type `NameList`, readonly

A `NameList`, as described in [DOM Level 3 Core], of all possible element information items or wildcards that can appear as a previous sibling of this element, or `null` if this element has no context or schema.

contentType of type `unsigned short`, readonly

The content type of an element as defined above.

requiredAttributes of type `NameList`, readonly

A `NameList`, as described in [DOM Level 3 Core], of required attribute information items that must appear on this element, or `null` if this element has no context or schema.

Methods**canRemoveAttribute**

Verifies if an attribute by the given name can be removed.

Parameters**attrname** of type `DOMString`

Name of attribute.

Return Value

unsigned short A validation state constant.

No Exceptions

`canRemoveAttributeNS`

Verifies if an attribute by the given local name and namespace can be removed.

Parameters

`namespaceURI` of type `DOMString`

The namespace URI of the attribute to remove.

`localName` of type `DOMString`

Local name of the attribute to be removed.

Return Value

unsigned short A validation state constant.

No Exceptions

`canRemoveAttributeNode`

Determines if an attribute node can be removed.

Parameters

`attrNode` of type `Node`

The Attr node to remove from the attribute list.

Return Value

unsigned short A validation state constant.

No Exceptions

`canSetAttribute`

Determines if the value for specified attribute can be set.

Parameters

`attrname` of type `DOMString`

Name of attribute.

`attrval` of type `DOMString`

Value to be assigned to the attribute.

Return Value

unsigned short A validation state constant.

No Exceptions

`canSetAttributeNS`

Determines if the attribute with given namespace and qualified name can be created if not already present in the attribute list of the element. If the attribute with the same qualified name and namespaceURI is already present in the element's attribute list, it tests whether the value of the attribute and its prefix can be set to the new value.

Parameters

namespaceURI of type DOMString
 namespaceURI of namespace.
qualifiedName of type DOMString
 Qualified name of attribute.
value of type DOMString
 Value to be assigned to the attribute.

Return Value

unsigned short A validation state constant.

No Exceptions

canSetAttributeNode

Determines if an attribute node can be added.

Parameters

attrNode of type Attr

Node in which the attribute can possibly be set.

Return Value

unsigned short A validation state constant.

No Exceptions

canSetTextContent

Determines if the text content of this node and its descendants can be set to the string passed in.

Parameters

possibleTextContent of type DOMString

Possible text content string.

Return Value

unsigned short A validation state constant.

No Exceptions

isElementDefined

Determines if name is defined in the schema. This only applies to global declarations [p.41]. This method is for non-namespace aware schemas.

Parameters

name of type DOMString

Name of element.

Return Value

unsigned short A validation state constant.

No Exceptions

isElementDefinedNS

Determines if name in this namespace is defined in the current context. Thus not only does this apply to global declarations [p.41] . but depending on the content, this may also apply to local definitions. This method is for namespace aware schemas.

Parameters

namespaceURI of type DOMString

 namespaceURI of namespace.

name of type DOMString

 Name of element.

Return Value

unsigned short A validation state constant.

No Exceptions**Interface *CharacterDataEditVAL***

This interface extends the *NodeEditVAL* [p.11] interface with additional methods for document editing. An object implementing this interface must also implement *CharacterData* interface. When validating *CharacterData* nodes, the *NodeEditVAL.nodeValidity(valType)* [p.14] operation must find the nearest parent node in order to do this; if no parent node is found, *NodeEditVAL.VAL_UNKNOWN* [p.12] is returned. In addition, when *NodeEditVAL.VAL_INCOMPLETE* [p.12] is passed in as an argument to the *NodeEditVAL.nodeValidity* [p.14] operation to operate on such nodes, the operation considers all the text and not just some of it.

IDL Definition

```
interface CharacterDataEditVAL : NodeEditVAL {
    unsigned short      isWhitespaceOnly();
    unsigned short      canSetData(in DOMString arg);
    unsigned short      canAppendData(in DOMString arg);
    unsigned short      canReplaceData(in unsigned long offset,
                                         in unsigned long count,
                                         in DOMString arg)
                                         raises(DOMException);
    unsigned short      canInsertData(in unsigned long offset,
                                         in DOMString arg)
                                         raises(DOMException);
    unsigned short      canDeleteData(in unsigned long offset,
                                         in unsigned long count)
                                         raises(DOMException);
};
```

Methods**canAppendData**

Determines if character data can be appended.

Parameters

arg of type DOMString

 Data to be appended.

Return Value

`unsigned short` A validation state constant.

No Exceptions

`canDeleteData`

Determines if character data can be deleted.

Parameters

`offset` of type `unsigned long`

Offset.

`count` of type `unsigned long`

Number of 16-bit units to delete.

Return Value

`unsigned short` A validation state constant.

Exceptions

`DOMException` `INDEX_SIZE_ERR`: Raised if the specified offset is negative or greater than the number of 16-bit units in data, or if the specified count is negative.

`canInsertData`

Determines if character data can be inserted.

Parameters

`offset` of type `unsigned long`

Offset.

`arg` of type `DOMString`

Argument to be set.

Return Value

`unsigned short` A validation state constant.

Exceptions

`DOMException` `INDEX_SIZE_ERR`: Raised if the specified offset is negative or greater than the number of 16-bit units in data.

`canReplaceData`

Determines if character data can be replaced.

Parameters

`offset` of type `unsigned long`

Offset.

`count` of type `unsigned long`

Replacement.

arg of type DOMString

Argument to be set.

Return Value

unsigned short A validation state constant.

Exceptions

DOMException INDEX_SIZE_ERR: Raised if the specified offset is negative or greater than the number of 16-bit units in data, or if the specified count is negative.

canSetData

Determines if character data can be set.

Parameters

arg of type DOMString

Argument to be set.

Return Value

unsigned short A validation state constant.

No Exceptions

isWhitespaceOnly

Determines if character data is only whitespace.

Return Value

unsigned short A validation state constant.

No Parameters

No Exceptions

1.3 Document Editing Interfaces

Appendix A: Validation Outcomes

Editor:

Ben Chang, Oracle

A.1 The nodeValidity and validateDocument methods

The following table describes all possible validation outcomes of the `NodeEditVAL.nodeValidity(valType)` [p.14] method.

Validation Type	Validity outcome		
	VAL_TRUE	VAL_FALSE	VAL_UNKNOWN
VAL_WF	The node is well-formed.	The node is not well-formed.	Not applicable.
VAL_NS_WF	The node is well-formed. Processor must take into account all the in-scope namespace declarations.	The node is not namespace well-formed. Processor must take into account all the in-scope namespace declarations.	Not applicable.
VAL_NS_WF	The node is well-formed. Processor must take into account all namespace declarations in scope.	The node is not namespace well-formed. Processor must take into account all the in-scope namespace declarations.	Not applicable.
VAL_SCHEMA	The node is valid: it complies with all the constraints expressed in the schema.	The node fails to comply to all the constraints expressed in the schema.	If the schema is an XML Schema, PSVI [validity] property value is unknown.
VAL_INCOMPLETE	The node is valid: it complies with the VAL_INCOMPLETE definition.	The node is invalid with regard to the VAL_INCOMPLETE definition.	If the schema is an XML Schema, PSVI [validity] property value is unknown.

The following table describes the outcome of the `DocumentEditVAL.validateDocument()` [p.11] and `NodeEditVAL.nodeValidity(valType)` [p.14] methods, with the latter called on the `DocumentEditVAL` [p.10] node with validationType `NodeEditVAL.VAL_SCHEMA` [p.12].

Methods	Validity outcome		
	VAL_TRUE	VAL_FALSE	VAL_UNKNOWN
validateDocument and nodeValidity, called on the Document node with validationType VAL_SCHEMA.	If the schema is a DTD, then the document valid constraint is satisfied. If the schema is an XML Schema, then the document validity is the same as the validity of the validation root, i.e., documentElement: PSVI [validity] valid.	Fails to satisfy the constraints defined.	If the schema is an XML Schema, then schema is not found or the declaration for the validation root is not found: PSVI [validity] unknown.

The following table describes outcomes for the NodeEditVAL.nodeValidity(valType) [p.14] method called with the validationType NodeEditVAL.VAL_SCHEMA [p.12] :

Node types	Validity outcome		
	VAL_TRUE	VAL_FALSE	VAL_UNKNOWN
Element	If the schema is a DTD, then element and attribute validity constraints, including attribute validity constraint defined below are satisfied. If the schema is an XML Schema, then PSVI [validity] valid.	Fails to satisfy the constraints defined.	If the schema is an XML Schema, then PSVI [validity] unknown.
Attr	If the schema is a DTD, then all validity constraints defined in section 3.3.1, "Attribute Type", required and fixed attribute are satisfied. If the schema is an XML Schema, then PSVI [validity] valid.	Fails to satisfy the constraints defined.	If the schema is an XML Schema, then PSVI [validity] unknown.
Text	The node is well-formed.	The node is not well-formed.	If no parent node is found.
CDataSection	The node is well-formed.	The node is not well-formed.	If no parent node is found.
ProcessingInstruction	The node is well-formed.	The node is not well-formed.	If no parent node is found.
Comment	The node is well-formed.	The node is not well-formed.	If no parent node is found.
EntityReference	Entity is declared.	Entity is not declared.	Not applicable.
Entity	Implementation-specific.	Implementation-specific.	Implementation-specific.
Notation	Implementation-specific.	Implementation-specific.	Implementation-specific.
DocumentType	Implementation-specific.	Implementation-specific.	Implementation-specific.
DocumentFragment	Not applicable.	Not applicable.	Not applicable.

A.2 Other validation operations

The table below describes validation outcomes from can* validation operations, such as `NodeEditVAL.canRemoveChild()` [p.13], or `ElementEditVAL.canSetAttributeNS` [p.17], `CharacterDataEditVAL.canAppendData()` [p.19]. All these operations attempt to validate with validityType `NodeEditVAL.VAL_INCOMPLETE` [p.12].

VAL_TRUE	VAL_FALSE	VAL_UNKNOWN
If the associated operation is performed, then the node would be valid with regards to the VAL_INCOMPLETE definition or if there is no schema found.	If the associated operation is performed, then the node would be invalid with regards to the VAL_INCOMPLETE definition.	Not applicable.

Note: If the document includes more than one type of schema [p.41] , e.g., DTD and XML Schema, and the DOMConfiguration "schema-type" parameter is not specified, the validation outcome for NodeEditVAL.VAL_INCOMPLETE [p.12] and NodeEditVAL.VAL_SCHEMA [p.12] is implementation-specific.

Appendix B: IDL Definitions

This appendix contains the complete OMG IDL [OMG IDL] for the Level 3 Document Object Model Validation definitions.

The IDL files are also available as: <http://www.w3.org/TR/2003/CR-DOM-Level-3-Val-20030730/idl.zip>

validation.idl:

```
// File: validation.idl

#ifndef _VALIDATION_IDL_
#define _VALIDATION_IDL_

#include "dom.idl"

#pragma prefix "dom.w3c.org"
module validation
{

    typedef dom::DOMString DOMString;
    typedef dom::DOMStringList DOMStringList;
    typedef dom::Node Node;
    typedef dom::NameList NameList;
    typedef dom::Attr Attr;
    typedef dom::DOMConfiguration DOMConfiguration;

Appendix D: ECMAScript Language Binding

This appendix contains the complete ECMAScript [ECMAScript] binding for the Level 3 Document Object Model Validation definitions.

Properties of the **ExceptionVAL** Constructor function:

ExceptionVAL.NO_SCHEMA_AVAILABLE_ERR

The value of the constant **ExceptionVAL.NO_SCHEMA_AVAILABLE_ERR** is 71.

Objects that implement the **ExceptionVAL** interface:

Properties of objects that implement the **ExceptionVAL** interface:

code

This property is a **Number**.

Objects that implement the **DocumentEditVAL** interface:

Objects that implement the **DocumentEditVAL** interface have all properties and functions of the **NodeEditVAL** interface as well as the properties and functions defined below.

Properties of objects that implement the **DocumentEditVAL** interface:

continuousValidityChecking

This property is a **Boolean** and can raise an object that implements the **DOMEException** interface or the **ExceptionVAL** interface or the **DOMEException** interface on setting.

config

This read-only property is an object that implements the **DOMConfiguration** interface.

Functions of objects that implement the **DocumentEditVAL** interface:

getDefinedElements(namespaceURI)

This function returns an object that implements the **NameList** interface.

The **namespaceURI** parameter is a **String**.

validateDocument()

This function returns a **Number**.

Properties of the **NodeEditVAL** Constructor function:

NodeEditVAL.VAL_WF

The value of the constant **NodeEditVAL.VAL_WF** is 1.

NodeEditVAL.VAL_NS_WF

The value of the constant **NodeEditVAL.VAL_NS_WF** is 2.

NodeEditVAL.VAL_INCOMPLETE

The value of the constant **NodeEditVAL.VAL_INCOMPLETE** is 3.

NodeEditVAL.VAL_SCHEMA

The value of the constant **NodeEditVAL.VAL_SCHEMA** is 4.

NodeEditVAL.VAL_TRUE

The value of the constant **NodeEditVAL.VAL_TRUE** is 5.

NodeEditVAL.VAL_FALSE

The value of the constant **NodeEditVAL.VAL_FALSE** is 6.

NodeEditVAL.VAL_UNKNOWN

The value of the constant **NodeEditVAL.VAL_UNKNOWN** is 7.

Objects that implement the **NodeEditVAL** interface:

Properties of objects that implement the **NodeEditVAL** interface:

defaultValue

This read-only property is a **String**.

enumeratedValues

This read-only property is an object that implements the **DOMStringList** interface.

Functions of objects that implement the **NodeEditVAL** interface:

canInsertBefore(newChild, refChild)

This function returns a **Number**.

The **newChild** parameter is an object that implements the **Node** interface.

The **refChild** parameter is an object that implements the **Node** interface.

canRemoveChild(oldChild)

This function returns a **Number**.

The **oldChild** parameter is an object that implements the **Node** interface.

canReplaceChild(newChild, oldChild)

This function returns a **Number**.

The **newChild** parameter is an object that implements the **Node** interface.

The **oldChild** parameter is an object that implements the **Node** interface.

canAppendChild(newChild)

This function returns a **Number**.

The **newChild** parameter is an object that implements the **Node** interface.

nodeValidity(valType)

This function returns a **Number**.

The **valType** parameter is a **Number**.

Properties of the **ElementEditVAL** Constructor function:

ElementEditVAL.VAL_EMPTY_CONTENTTYPE

The value of the constant **ElementEditVAL.VAL_EMPTY_CONTENTTYPE** is 1.

ElementEditVAL.VAL_ANY_CONTENTTYPE

The value of the constant **ElementEditVAL.VAL_ANY_CONTENTTYPE** is 2.

ElementEditVAL.VAL_MIXED_CONTENTTYPE

The value of the constant **ElementEditVAL.VAL_MIXED_CONTENTTYPE** is 3.

ElementEditVAL.VAL_ELEMENTS_CONTENTTYPE

The value of the constant **ElementEditVAL.VAL_ELEMENTS_CONTENTTYPE** is 4.

ElementEditVAL.VAL_SIMPLE_CONTENTTYPE

The value of the constant **ElementEditVAL.VAL_SIMPLE_CONTENTTYPE** is 5.

Objects that implement the **ElementEditVAL** interface:

Objects that implement the **ElementEditVAL** interface have all properties and functions of the **NodeEditVAL** interface as well as the properties and functions defined below.

Properties of objects that implement the **ElementEditVAL** interface:

allowedChildren

This read-only property is an object that implements the **NameList** interface.

allowedFirstChildren

This read-only property is an object that implements the **NameList** interface.

allowedParents

This read-only property is an object that implements the **NameList** interface.

allowedNextSiblings

This read-only property is an object that implements the **NameList** interface.

allowedPreviousSiblings

This read-only property is an object that implements the **NameList** interface.

allowedAttributes

This read-only property is an object that implements the **NameList** interface.

requiredAttributes

This read-only property is an object that implements the **NameList** interface.

contentType

This read-only property is a **Number**.

Functions of objects that implement the **ElementEditVAL** interface:

canSetTextContent(possibleTextContent)

This function returns a **Number**.

The **possibleTextContent** parameter is a **String**.

canSetAttribute(attrname, attrval)

This function returns a **Number**.

The **attrname** parameter is a **String**.

The **attrval** parameter is a **String**.

canSetAttributeNode(attrNode)

This function returns a **Number**.

The **attrNode** parameter is an object that implements the **Attr** interface.

canSetAttributeNS(namespaceURI, qualifiedName, value)

This function returns a **Number**.

The **namespaceURI** parameter is a **String**.

The **qualifiedName** parameter is a **String**.

The **value** parameter is a **String**.

canRemoveAttribute(attrname)

This function returns a **Number**.

The **attrname** parameter is a **String**.

canRemoveAttributeNode(attrNode)

This function returns a **Number**.

The **attrNode** parameter is an object that implements the **Node** interface.

canRemoveAttributeNS(namespaceURI, localName)

This function returns a **Number**.

The **namespaceURI** parameter is a **String**.

The **localName** parameter is a **String**.

isElementDefined(name)

This function returns a **Number**.

The **name** parameter is a **String**.

isElementDefinedNS(namespaceURI, name)

This function returns a **Number**.

The **namespaceURI** parameter is a **String**.

The **name** parameter is a **String**.

Objects that implement the **CharacterDataEditVAL** interface:

Objects that implement the **CharacterDataEditVAL** interface have all properties and functions of the **NodeEditVAL** interface as well as the properties and functions defined below.

Functions of objects that implement the **CharacterDataEditVAL** interface:

isWhitespaceOnly()

This function returns a **Number**.

canSetData(arg)

This function returns a **Number**.

The **arg** parameter is a **String**.

canAppendData(arg)

This function returns a **Number**.

The **arg** parameter is a **String**.

canReplaceData(offset, count, arg)

This function returns a **Number**.

The **offset** parameter is a **Number**.

The **count** parameter is a **Number**.

The **arg** parameter is a **String**.

This function can raise an object that implements the **DOMException** interface.

canInsertData(offset, arg)

This function returns a **Number**.

The **offset** parameter is a **Number**.

The **arg** parameter is a **String**.

This function can raise an object that implements the **DOMException** interface.

canDeleteData(offset, count)

This function returns a **Number**.

The **offset** parameter is a **Number**.

The **count** parameter is a **Number**.

This function can raise an object that implements the **DOMException** interface.

Appendix E: Acknowledgements

Many people contributed to the DOM specifications (Level 1, 2 or 3), including members of the DOM Working Group and the DOM Interest Group. We especially thank the following:

Andrew Watson (Object Management Group), Andy Heninger (IBM), Angel Diaz (IBM), Arnaud Le Hors (W3C and IBM), Ashok Malhotra (IBM and Microsoft), Ben Chang (Oracle), Bill Smith (Sun), Bill Shea (Merrill Lynch), Bob Sutor (IBM), Chris Lovett (Microsoft), Chris Wilson (Microsoft), David Brownell (Sun), David Ezell (Hewlett Packard Company), David Singer (IBM), Dimitris Dimitriadis (Improve AB and invited expert), Don Park (invited), Elena Litani (IBM), Eric Vasilik (Microsoft), Gavin Nicol (INSO), Ian Jacobs (W3C), James Clark (invited), James Davidson (Sun), Jared Sorensen (Novell), Jeroen van Rotterdam (X-Hive Corporation), Joe Kesselman (IBM), Joe Lapp (webMethods), Joe Marini (Macromedia), Johnny Stenback (Netscape/AOL), Jon Ferraiolo (Adobe), Jonathan Marsh (Microsoft), Jonathan Robie (Texcel Research and Software AG), Kim Adamson-Sharpe (SoftQuad Software Inc.), Lauren Wood (SoftQuad Software Inc., *former Chair*), Laurence Cable (Sun), Mark Davis (IBM), Mark Scardina (Oracle), Martin Dürst (W3C), Mary Brady (NIST), Mick Goulish (Software AG), Mike Champion (Arbortext and Software AG), Miles Sabin (Cromwell Media), Patti Lutsky (Arbortext), Paul Gross (Arbortext), Peter Sharpe (SoftQuad Software Inc.), Phil Karlton (Netscape), Philippe Le Hégaret (W3C, *W3C team contact and former Chair*), Ramesh Lekshmynarayanan (Merrill Lynch), Ray Whitmer (iMall, Excite@Home, and Netscape/AOL, *Chair*), Rezaur Rahman (Intel), Rich Rollman (Microsoft), Rick Gessner (Netscape), Rick Jelliffe (invited), Rob Relyea (Microsoft), Scott Isaacs (Microsoft), Sharon Adler (INSO), Steve Byrne (JavaSoft), Tim Bray (invited), Tim Yu (Oracle), Tom Pixley (Netscape/AOL), Vidur Apparao (Netscape), Vinod Anupam (Lucent).

Thanks to all those who have helped to improve this specification by sending suggestions and corrections (Please, keep bugging us with your issues!).

Special thanks to the DOM Conformance Test Suites contributors: Curt Arnold, Fred Drake, Mary Brady (NIST), Rick Rivello (NIST), Robert Clary (Netscape).

E.1 Production Systems

This specification was written in XML. The HTML, OMG IDL, Java and ECMAScript bindings were all produced automatically.

Thanks to Joe English, author of cost, which was used as the basis for producing DOM Level 1. Thanks also to Gavin Nicol, who wrote the scripts which run on top of cost. Arnaud Le Hors and Philippe Le Hégaret maintained the scripts.

After DOM Level 1, we used Xerces as the basis DOM implementation and wish to thank the authors. Philippe Le Hégaret and Arnaud Le Hors wrote the Java programs which are the DOM application.

Thanks also to Jan Kärrman, author of html2ps, which we use in creating the PostScript version of the specification.

E.1 Production Systems

Glossary

Editors:

Arnaud Le Hors, W3C

Robert S. Sutor, IBM Research (for DOM Level 1)

Several of the following term definitions have been borrowed or modified from similar definitions in other W3C or standards documents. See the links within the definitions for more information.

global declaration

A *global declaration* is a schema declaration, usually for an element or an attribute, that is available for use in content models throughout the schema [p.41] , i.e. a declaration that is not bound to a particular context.

namespace well-formed

A node is a *namespace well-formed* XML node if it is a well-formed [p.41] node, and follow the productions and namespace constraints. If [XML 1.0] is used, the constraints are defined in [XML Namespaces]. If [XML 1.1] is used, the constraints are defined in [XML Namespaces 1.1].

schema

A *schema* defines a set of structural and value constraints applicable to XML documents. Schemas can be expressed in schema languages, such as DTD, XML Schema, etc.

well-formed

A node is a *well-formed* XML node if its serialized form, without doing any transformation during its serialization, matches its respective production in [XML 1.0] or [XML 1.1] (depending on the XML version in use) with all well-formedness constraints related to that production, and if the entities which are referenced within the node are also well-formed. If namespaces for XML are in use, the node must also be namespace well-formed [p.41] .
