Abstract

This document, developed by the Rule Interchange Format (RIF) Working Group, specifies RIF-Core, a common subset of RIF-BLD and RIF-PRD based on RIF-DTB 1.0. The RIF-Core presentation syntax and semantics are specified by restriction in two different ways. First, RIF-Core is specified by restricting the syntax and semantics of RIF-BLD, and second, by restricting RIF-PRD. The XML serialization syntax of RIF-Core is specified by a mapping from the presentation syntax. A normative XML schema is also provided.
Status of this Document

May Be Superseded

This section describes the status of this document at the time of its publication. Other documents may supersede this document. A list of current W3C publications and the latest revision of this technical report can be found in the W3C technical reports index at http://www.w3.org/TR/.

Set of Documents

This document is being published as one of a set of 10 documents:

1. RIF Overview
2. RIF Core Dialect (this document)
3. RIF Basic Logic Dialect
4. RIF Framework for Logic Dialects
5. RIF RDF and OWL Compatibility
6. RIF Datatypes and Built-Ins 1.0
7. RIF Production Rule Dialect
8. RIF Test Cases
9. RIF Combination with XML data
10. OWL 2 RL in RIF

Summary of Changes

There have been no substantive changes since the previous version. For details on the minor changes see the change log and color-coded diff.

Please Comment By 29 October 2009

The Rule Interchange Format (RIF) Working Group seeks to gather experience from implementations in order to increase confidence in the language and meet specific exit criteria. This document will remain a Candidate Recommendation until at least 29 October 2009. After that date, when and if the exit criteria are met, the group intends to request Proposed Recommendation status.

Please send reports of implementation experience, and other feedback, to public-rif-comments@w3.org (public archive). Reports of any success or difficulty with the test cases are encouraged. Open discussion among developers is welcome at public-rif-dev@w3.org (public archive).
No Endorsement

Publication as a Candidate Recommendation does not imply endorsement by the W3C Membership. This is a draft document and may be updated, replaced or obsoleted by other documents at any time. It is inappropriate to cite this document as other than work in progress.

Patents

This document was produced by a group operating under the 5 February 2004 W3C Patent Policy. W3C maintains a public list of any patent disclosures made in connection with the deliverables of the group; that page also includes instructions for disclosing a patent. An individual who has actual knowledge of a patent which the individual believes contains Essential Claim(s) must disclose the information in accordance with section 6 of the W3C Patent Policy.

1 Overview

This specification describes RIF-Core (the Core dialect of the Rule Interchange Format). From a theoretical perspective, RIF-Core corresponds to the language of definite Horn rules without function symbols (often called 'Datalog') with a standard first-order semantics. RIF-Core thus is a subset of RIF-BLD [RIF-BLD]. At the same time, RIF-Core is a language of production rules where conclusions are interpreted as assert actions. RIF-Core thus also is a subset of RIF-PRD [RIF-PRD]. Moreover, RIF-Core is based on built-in functions and predicates over selected XML Schema datatypes, as specified in RIF-DTB 1.0 [RIF-DTB]. The common subset of RIF-BLD and RIF-PRD is specified based on RIF-DTB 1.0.

Syntactically, RIF-Core has a number of Datalog extensions to support features such as objects and frames as in F-logic [KLW95], internationalized resource identifiers (or IRIs, defined by [RFC-3987]) as identifiers for concepts, and XML Schema datatypes [XML-SCHEMA2]. In addition, RIF RDF and OWL Compatibility [RIF-RDF+OWL] defines the syntax and semantics of integrated RIF-Core/RDF and RIF-Core/OWL languages. These features make RIF-Core a Web-aware language. However, it should be kept in mind that RIF is designed to enable interoperability among rule languages in general, and its uses are not limited to the Web.

RIF-Core is defined as a specialization of RIF-BLD (hence of [RIF-FLD], making it a starting point of the RIF extensibility framework). It is a syntactic subset of RIF-BLD, so that a well-formed RIF-Core formula (including document and condition formulas) is also a well-formed RIF-BLD formula.

RIF-Core is also a syntactic subset of [RIF-PRD]. It is intended that a RIF-PRD consumer can treat a RIF-Core document as if it was a RIF-PRD rule set while it also conforms to the normative RIF-Core first order semantics. However, due to the presence of built-in functions and predicates there are rule sets in the syntactic intersection of RIF-PRD and RIF-BLD which would not terminate under RIF-PRD semantics. We therefore define a notion of safe RIF-Core rules, which is a subset of RIF-Core rules that can be executed using a forward chaining strategy, and we define conformance in terms of such safe rules. These notions of safeness and conformance are defined formally in section 5 Conformance and Safeness.

RIF-Core is not the maximal common subset of RIF-BLD and RIF-PRD. It omits some features from the intersection which do not significantly add to the
expressiveness of the language and are judged to be not widely supported by rule languages.

To give a preview, here is a simple complete RIF-Core example deriving a ternary relation from its inverse.

**Example 1** (An introductory RIF-Core example).

A rule can be written in English to derive `buy` relationships from the `sell` relationships that are stored as facts (e.g., as exemplified by the English statements below):

- A buyer buys an item from a seller if the seller sells the item to the buyer.
- John sells LeRif to Mary.

The fact Mary buys LeRif from John can be logically derived by a modus ponens argument. Assuming Web IRIs for the predicates `buy` and `sell`, as well as for the individuals John, Mary, and LeRif, the above English phrase can be represented in RIF-Core Presentation Syntax as follows.

```xml
Document(
  Prefix(cpt <http://example.com/concepts#>)
  Prefix(ppl <http://example.com/people#>)
  Prefix(bks <http://example.com/books#>)

  Group
  {
    Forall ?Buyer ?Item ?Seller (
    )
    cpt:sell(ppl:John bks:LeRif ppl:Mary)
  }
)
```

For the interchange of documents containing such rules (and facts), an equivalent RIF-Core XML syntax is provided in this specification. To formalize their meaning, a RIF-Core Semantics is specified.

This document assumes familiarity with [RIF-BLD] or [RIF-PRD], as RIF-Core is derived from these documents via syntactic restrictions.

## 2 RIF-Core Presentation Syntax

Like RIF-BLD and RIF-PRD, RIF-Core has both a presentation syntax and an XML syntax. It is defined in "mathematical English," a special form of English for communicating mathematical definitions, examples, etc. and by an EBNF syntax. The mathematical English is normative, the EBNF is not normative; both instances
of the presentation syntax are not intended to be a concrete syntax for RIF-Core. The English presentation syntax deliberately leaves out details such as the delimiters of the various syntactic components, escape symbols, parenthesizing, precedence of operators, and the like. Since RIF is an interchange format, it uses XML, and only XML, as its concrete syntax. RIF-Core conformance is described in terms of semantics-preserving mappings.

Since RIF-Core is a syntactic subset of RIF-BLD, this section defines the presentation syntax of RIF-Core as a restriction on the presentation syntax of RIF-BLD.

2.1 Alphabet of RIF-Core

The alphabet of the presentation language of RIF-Core is the alphabet of the RIF-BLD presentation language with the exclusion of the symbol $$\#$$ (subclass) and the set of symbols ArgNames (used for named-argument uniterms).

2.2 Terms of RIF-Core

The Terms of RIF-Core are the terms of RIF-BLD with the exclusion of subclass terms and of terms with named arguments. In RIF-Core there are only closed ground lists.

Definition (List Term)

- A closed ground list has the form List(t₁...tₘ), where m ≥ 0 and t₁, ..., tₘ are ground terms (no tail and no variables are allowed).

A closed list of the form List() (i.e., a list in which m=0) is called the empty list.

2.3 Formulas of RIF-Core

The Formulas of RIF-Core are the formulas of RIF-BLD with the following restrictions.

- Subterms that occur inside atomic formulas can be variables, constants, ground list, or external positional terms. This implies that RIF-Core only allows external function applications.
- Equality terms and class membership terms cannot occur in rule conclusions — they are allowed only in rule premises.
- Terms with named arguments and subclass terms are excluded from RIF-Core.
2.4 Annotations and Documents

RIF-Core allows every term and formula to be optionally annotated in the same way as in RIF-BLD. The frame formulas that are allowed as part of an annotation must be syntactically correct for RIF-Core. In particular, no function symbols are allowed in such a formula.

2.5 Well-formed Formulas

A syntactically correct RIF-Core formula that passes the well-formedness test for RIF-BLD is also a well-formed RIF-Core formula.

Recall that RIF-Core does not allow uninterpreted (i.e., non-external) function symbols. Therefore no symbol in RIF-Core can occur in the context of an (uninterpreted) function symbol.

2.6 EBNF Grammar for the Presentation Syntax of RIF-Core

Until now, we have used mathematical English to specify the syntax of RIF-Core as a restriction on RIF-BLD. Tool developers, however, may prefer EBNF notation, which provides a more succinct view of the syntax. However, EBNF is unable to express all of the well-formedness conditions. For instance, the requirement that each symbol appear in only one context cannot be expressed in EBNF. As a result, the EBNF grammar defines a strict superset of RIF-Core. For that reason this section is not normative.

The EBNF for the RIF-Core presentation syntax is given as follows. For convenience of reading we show the entire EBNF divided into three parts (rules, conditions, and annotations); these are derived from the EBNF for RIF-BLD by applying the restrictions described above.

**Rule Language:**

```
Base ::= 'Base' '({' ANGLEBRACKIRI '})
Prefix ::= 'Prefix' '({' Name ANGLEBRACKIRI '})
Import ::= IRIMETA? 'Import' '({' LOCATOR PROFILE? '})
Group ::= IRIMETA? 'Group' '({' (RULE | Group)+ '})'
RULE ::= (IRIMETA? 'Forall' Var+ '({' CLAUSE '})') | CLAUSE
CLAUSE ::= Implies | ATOMIC
Implies ::= IRIMETA? (ATOMIC | 'And' '({' ATOMIC* '})') ':-' FORMULA
LOCATOR ::= ANGLEBRACKIRI
PROFILE ::= ANGLEBRACKIRI
```
Condition Language:

```
FORMULA ::= IRIMETA? 'And' '(' FORMULA* ')' |
          IRIMETA? 'Or' '(' FORMULA* ')' |
          IRIMETA? 'Exists' Var+ '(' FORMULA ')' |
          ATOMIC |
          IRIMETA? Equal |
          IRIMETA? Member |
          IRIMETA? 'External' '(' Atom ')' |

ATOMIC ::= IRIMETA? (Atom | Frame) |
Atom ::= UNITERM |
UNITERM ::= Const '(' (TERM* ')') |
GROUNDUNITERM ::= Const '(' GROUNDTERM* ')' |
Equal ::= TERM '=' TERM |
Member ::= TERM '#' TERM |
Frame ::= TERM '[' (TERM '->' TERM)* ']' |
TERM ::= IRIMETA? (Const | Var | List | 'External' '(' Expr ')') |
GROUNDTERM ::= IRIMETA? (Const | List | 'External' '(' GROUNDUNITERM) |
Expr ::= UNITERM |
List ::= 'List' '(' GROUNDTERM* ')' |
Const ::= '' UNICODESTRING ''^^' SYMSPACE | CONSTSHORT |
Name ::= UNICODESTRING |
Var ::= '?' UNICODESTRING |
SYMSPACE ::= ANGLEBRACKIRI | CURIE |
```

Annotations:

```
IRIMETA ::= '(*' IRICONST? (Frame | 'And' '(' Frame* ')')? '*')'
```

ANGLEBRACKIRI, CURIE, CONSTSHORT, and UNICODESTRING are defined in Section Shortcuts for Constants in RIF’s Presentation Syntax of [RIF-DTB].

The following subsections explain and exemplify the Condition Language, Rule Language, and Annotations parts.

2.6.1 EBNF for the RIF-Core Condition Language

The RIF-Core Condition Language represents formulas that can be used in the premises of RIF-Core rules (also called rule bodies). The EBNF grammar for a superset of the RIF-Core condition language is shown in the above conditions part.

This is a specialization of the EBNF for the RIF-BLD condition language specified in the RIF-BLD conditions part reflecting the syntax restrictions on RIF-Core described normatively in sections 2.1 through 2.5 above.

Example 3 from the RIF-BLD document, illustrates some RIF-BLD conditions. All the conditions, except for the terms with named arguments and the equalities with (non-ground) list terms, are also RIF-Core conditions.
2.6.2 EBNF for the RIF-Core Rule Language

The presentation syntax for RIF-Core rules is based on the syntax in Section EBNF
for the RIF-Core Condition Language with the productions shown in the above
rules part.

Again, this is a specialization of the EBNF for the RIF-BLD rule language specified
in the RIF-BLD rules part reflecting the syntax restrictions on RIF-Core described
normatively in sections 2.1 through 2.5 above.

Example 4 from the RIF-BLD document also illustrates a set of RIF-Core rules. In
contrast, Example 7 from the RIF-BLD document shows a formula that is not in
RIF-Core because it includes terms with named arguments, which are not allowed
in this dialect.

2.6.3 EBNF for RIF-Core Annotations

The presentation syntax for RIF-Core annotations uses the production shown in the
above annotations part.

This defines the specialization of the EBNF for the RIF-BLD annotation language
specified through the RIF-BLD annotations part where annotation frames use the
more restricted TERMS defined in the above conditions part of RIF-Core.

Example 5 from the RIF-BLD document also illustrates a RIF-Core document that
contains an annotated group formula.

3 RIF-Core as a Specialization of RIF-PRD

RIF-Core is a syntactic subset of RIF-PRD, and this section defines the
presentation syntax of RIF-Core as a restriction on the presentation syntax of RIF-
PRD Conditions, Actions, and Rules.

3.1 Alphabet of RIF-Core

The alphabet of the presentation language of RIF-Core is the alphabet of the RIF-
PRD presentation language (Conditions, Actions, and Rules) with the exclusion of
the symbols ##, such that, Not, INeg, Do, Assert, Retract, Modify, Execute, and New.
3.2 Terms of RIF-Core

The Terms of RIF-Core are the terms of RIF-PRD with the exclusion of subclass terms. In Core there are only closed ground lists.

3.3 Formulas of RIF-Core

The Formulas of RIF-Core are the formulas of RIF-PRD with the exclusion of negation formulas.

3.4 Annotations and Documents

RIF-Core allows every term and formula to be optionally annotated in the same way as in RIF-PRD. The frame formulas that are allowed as part of an annotation must be syntactically correct for RIF-Core.

3.5 Well-formed Formulas

A syntactically correct RIF-Core formula that passes the well-formedness test for RIF-PRD is also a well-formed RIF-Core formula.

3.6 Rules and Groups

A RIF-Core rule is a well-formed RIF-PRD rule with no nested forall, no binding pattern, and where the action block is a single atom, a single frame, or a conjunction of atoms and/or frames. A RIF-Core group is a RIF-PRD group without strategy and without priority.

4 RIF-Core Semantics

RIF-Core is a syntactic subset of RIF-BLD, and the semantics of RIF-Core is identical to the semantics of RIF-BLD for that subset. RIF-Core is also a syntactic subset of RIF-PRD, and the semantics of RIF-Core is also identical to the semantics of RIF-PRD for that subset.

5 XML Serialization Syntax for RIF-Core

The XML syntax of RIF-Core is a subset of the XML syntax of RIF-BLD. All XML tags of RIF-BLD (except Subclass, sub and super) are supported, but the XML schema of RIF-Core restricts their context with respect to what is allowed by the
XML schema of RIF-BLD. The semantics of the XML syntax for RIF-Core is defined through the same RIF-BLD XML-to-presentation syntax mapping.

XML serialization of a complete RIF-Core document appears in the RIF-BLD specification as Example 8.

6 Safeness Criteria

RIF-Core is a syntactic subset of both RIF-BLD and RIF-PRD. The semantics of a RIF-Core formula is the same as the semantics given to it by RIF-BLD.

All RIF-Core documents are also syntactically valid RIF-PRD documents. However, some formulas may be unsafe and cannot be executed under the RIF-PRD operational semantics. Thus, in order to allow production rule systems and logic programming systems to interchange rules via RIF-Core, we restrict RIF-Core to safe rules so that the logical semantics of RIF-BLD and the operational fixed-point semantics of RIF-PRD coincide.

6.1 Safeness

Intuitively, safeness of rules guarantees that, when performing reasoning in a forward-chaining manner, it is possible to find bindings for all the variables in the rule so that the condition can be evaluated.

To define safeness, we need to define, first, the notion of binding patterns for externally defined terms, as well as under what conditions variables are considered bound.

Definition (Binding pattern). Binding patterns are lists of the form $(p_1, \ldots, p_n)$, such that $p_i = b$ or $p_i = u$, for $1 \leq i \leq n$: $b$ stands for a "bound" and $u$ stands for an "unbound" argument.

Each external function or predicate has an associated list of valid binding patterns. We define here the binding patterns valid for the functions and predicates defined in [RIF-DTB].

Every function or predicate $f$ defined in [RIF-DTB] has a valid binding pattern for each of its schemas with only the symbol $b$ such that its length is the number of arguments in the schema. In addition,

- the external predicate $\text{pred:iri-string}$ has the valid binding patterns $(b, u)$ and $(u, b)$ and
- the external predicate $\text{pred:list-contains}$ has the valid binding pattern $(b, u)$.

The functions and predicates defined in [RIF-DTB] have no other valid binding patterns.
To keep the definitions concise and intuitive, *boundedness* and *safeness* are defined, below, for condition formulas in disjunctive normal form, that can be existentially quantified themselves, but that contain, otherwise, no existential sub-formula. The definitions apply to any valid RIF-Core condition formula, because they can always, in principle, be put in that form, by applying the following syntactic transforms, in sequence:

1. if \( f \) contains existential sub-formulas, all the quantified variables are renamed, if necessary, and given a name that is unique in \( f \), and the scope of the quantifiers is extended to \( f \). Assume, for instance, that \( f \) has an existential sub-formula, \( sf = \text{Exists} \ \text{v}_1...\text{v}_n(\text{sf}') \), \( n \geq 1 \), such that the names \( \text{v}_1...\text{v}_n \) do not occur in \( f \) outside of \( sf \). After the transform, \( f \) becomes \( \text{Exists} \ \text{v}_1...\text{v}_n(f') \), where \( f' \) is \( f \) with \( sf \) replaced by \( sf' \). The transform is applied iteratively to all the existential sub-formulas in \( f \);
2. the (possibly existentially quantified) resulting formula is rewritten in disjunctive normal form ([Mendelson97], p. 30).

**Definition (Boundedness).** An external function term $\text{External}(f(t_1,...,t_n))$ is *bound* in a condition formula, if and only if $f$ has a valid binding pattern $(p_1,...,p_n)$ and, for all $j$, $1 \leq j \leq n$, such that $p_j=b$, $t_j$ is bound in the formula.

A variable, $v$, is *bound* in an atomic formula, $a$, if and only if

- $a$ is neither an equality nor an external predicate, and $v$ occurs as an argument in $a$;
- or $v$ is bound in the conjunction formula $f = \text{And}(a)$.

A variable, $v$, is *bound* in a conjunction formula, $f = \text{And}(c_1...c_n)$, \( n \geq 1 \), if and only if, either

- $v$ is bound in at least one of the conjuncts;
- or $v$ occurs as the $j$-th argument in a conjunct, $c_i$, that is an externally defined predicate, and the $j$-th position in a binding pattern that is associated with $c_i$ is $u$, and all the arguments that occur, in $c_i$, in positions with value $b$ in the same binding pattern are bound in $f' = \text{And}(c_1...c_{i-1} \ c_i+1...c_n)$;
- or $v$ occurs in a conjunct, $c_i$, that is an equality formula, and $v$ occurs as the term on one side of the equality, and the term on the other side of the equality is bound in $f' = \text{And}(c_1...c_{i-1} \ c_{i+1}...c_n)$.

A variable, $v$, is *bound* in a disjunction formula, if and only if $v$ is bound in every disjunct where it occurs;

A variable, $v$, is *bound* in an existential formula, $\text{Exists} \ v_1,...,v_n(f')$, \( n \geq 1 \), if and only if $v$ is bound in $f'$. □
Notice that the variables, \(v_1, \ldots, v_n\), that are existentially quantified in an existential formula \(f = \text{Exists } v_1, \ldots, v_n (f')\), are bound in any formula, \(F\), that contains \(f\) as a sub-formula, if and only if they are bound in \(f\), since they do not exist outside of \(f\).

**Definition (Safeness).** A variable, \(v\), is **safe** in a condition formula, \(f\), if and only if

- \(f\) is an atomic formula and \(f\) is not an equality formula in which both terms are variables, and \(v\) occurs in \(f\);
- or \(f\) is a conjunction, \(f = \text{And}(c_1 \ldots c_n), n \geq 1\), and \(v\) is safe in at least one conjunct in \(f\), or \(v\) occurs in a conjunct, \(c_i\), that is an equality formula in which both terms are variables, and \(v\) occurs as the term on one side of the equality, and the variable on the other side of the equality is safe in \(f' = \text{And}(c_1 \ldots c_{i-1} c_{i+1} \ldots c_n)\);
- or \(f\) is a disjunction, and \(v\) is safe in every disjunct;
- or \(f\) is an existential formula, \(f = \text{Exists } v_1, \ldots, v_n (f'), n \geq 1\), and \(v\) is safe in \(f'\).

A RIF-Core rule, \(r\) is **safe** if and only if

- \(r\) is a variable free atomic formula,
- or \(r\) is a universal fact, \(\text{Forall } v_1, \ldots, v_n (f), n \geq 1\), and \(f\) is variable free,
- or \(r\) is a rule implication, \(\varphi :\text{-}\psi\), and all the variables that occur in \(\varphi\) are safe in \(\psi\), and all the variables that occur in \(\psi\) are bound in \(\psi\);
- or \(r\) is a universal rule, \(\text{Forall } v_1, \ldots, v_n (r'), n \geq 1\), and \(r'\) is safe.

A group, \(\text{Group } (s_1 \ldots s_n), n \geq 0\), is **safe** if and only if

- it is empty, that is, \(n = 0\);
- or \(s_1\) and ... and \(s_n\) are safe.

A document is **safe** if and only if

- it contains a safe group, or no group at all,
- and all the documents that it imports are safe.

**Example.** Consider the following formula:

\[
\text{Forall } ?x ?y ?z ?u
\quad (\text{ex:p(?x)} :\text{-}\text{Or( And( ex:q(?z)
\quad \text{External(pred:iri-string(?x ?z))})
\quad \text{And( ?x=?y ?y=?u ex:q(?u))})}
\]

One can verify that this formula is safe, in the following way: the only variable appearing in the conclusion of the rule is \(?x\); \(?x\) is safe in the first component of the disjunction, because it occurs in the atomic formula \(\text{pred:iri-string(?x,?z)}\). It is also safe in the second disjunct, because it occurs as the left term in an
equality formula where the right term is \(?y\), which is safe because it occurs as the left term in an equality formula where the right term is \(?u\), which is safe because it occurs in the atomic formula \(\text{ex:q}(\?u)\). Being safe in both disjuncts, \(?x\) is safe in the disjunction.

Moreover, \(?x\), \(?y\), \(?z\) and \(?u\) are all bound in the body of the rule:

- \(?z\) is bound in the first disjunct because it occurs as an argument in the atom \(\text{ex:q}(\?z)\). Therefore, it is bound in the disjunction because it does not occur in the other disjunct;
- \(?u\) is bound in the second disjunct because it occurs as an argument in the atom \(\text{ex:q}(\?u)\). Therefore, it is bound in the disjunction because it does not occur in the other disjunct;
- \(?y\) is bound in the second disjunct because it occurs as the left term in an equality formula where the right term is \(?u\), which is bound in the conjunction without that equality formula. Therefore, it is bound in the disjunction because it does not occur in the other disjunct;
- \(?x\) is bound in the first disjunct because \((u,b)\) is a valid binding pattern for \(\text{pred:iri-string}\), where \(?x\) occurs as the first argument, and \(?z\), which occurs as the second argument, is bound in the conjunction without the external predicate. \(?x\) is also bound in the second disjunct, because it occurs as the left term in an equality formula where the right term is \(?y\), which is bound in the conjunction without that equality formula. Therefore, \(?x\) is bound in the disjunction.

6.2 Strong Safeness (Informative)

While safeness guarantees the possibility to do forward chaining with the rules, it does not guarantee that it is possible to construct a finite grounding. For this purpose we define strong safeness.

The conformance clauses for RIF-Core only require conformance over safe rule sets as defined above. However, some rule engines, such as some Datalog engines, are only able to process rule sets which can be finitely grounded. For maximum interoperability with such systems it is recommended that RIF-Core producers restrict themselves to strongly safe rule sets where possible.

Let \(R\) be a set of safe rule implications \(\varphi :- \psi\) and let \(P\) be the set of pairs \((p,n)\), where \(p\) is a predicate symbol and \(n\) is a nonnegative integer (an arity). For the purposes of the definitions in this section we view frames \(a[b -> c]\) and membership formulas \(a\#b\), respectively, as ternary and binary predicate symbols, and so \((->,3), (#,2) \in P\). Note that equality \(=\) does not appear in \(P\).

We define the graph of variable dependencies of a set of atomic formulas \(A\) as a labeled directed graph \(G_{R}=(V,E,L)\), where the labeling function \(L\) maps edges to sets of external function and predicate symbols, \(V\) is the set of variables appearing
in A, and E is the smallest set and L’ is the smallest function such that for every variable ?V

- for every atomic formula ?V=t or t=?V in A and every variable ?V’≠?V appearing in t such that \( f_1, \ldots, f_n \), \( 0 \leq n \), are the function symbols of the terms in t (including t itself) in which ?V’ appears, \( (?V, ?V') \in E \) and \( \{f_1, \ldots, f_n\} \in L'((?V, ?V')) \), and
- for every external atomic formula External(\( f(t_1, \ldots, t_n) \)) in A, every \( i \in \{1, \ldots, n\} \) such that \( t_i=?V \), every valid binding pattern \( (p_1, \ldots, p_n) \) of \( f \) such that \( p_i=u \), and every variable ?V appearing in some \( t_j \) such that \( f_1, \ldots, f_m \), \( 0 \leq m \), are the function symbols of the terms in \( t_j \) in which ?V appears, \( (?V, ?V') \in E \) and \( \{f_1, \ldots, f_m\} \in L'((?V, ?V')) \).

Finally, L is defined as: for every \( (e,e') \in E \), \( L((e,e')) \) is the union of the minimal sets in \( L'((e,e')) \).

For every rule implication, \( \phi :- \psi \), we define the collection, \( B_{\psi} \), of the sets of the atomic formulas in each of the conjunctions that are the components of \( \psi' \), where \( \psi' \) is \( \psi \) rewritten as a condition formula in disjunctive normal form, possibly existentially quantified itself, but otherwise containing no existential sub-formula (see description of the transform in the section Safeness, above).

The dependency graph of a set of implications \( R \) is a labelled directed graph \( G_R=(V, E) \), where edges are triples \((v, v', l)\) such that \( v, v' \in V \) and \( l \) is a set of external function and predicate symbols. V is defined as: for every \( (p, n) \in P \) and every integer \( i \) such that \( 1 \leq i \leq n \), \( (p, n)/i \in E \). is the smallest set such that for every \( (p, n)/i \in V \) and every \( \phi :- \psi \) in \( R \) such that there is an atomic subformula \( p(t_1, \ldots, t_i, \ldots, t_n) \) of \( \phi \), then for every variable ?V appearing in \( t_i \):

- for every non-external and non-equality atomic formula with predicate symbol \( p' \) and \( m \) arguments in any \( A \in B_{\psi} \) and every \( j \in \{1, \ldots, m\} \) such that a variable ?V’ is the \( j \)th argument and there is a path from ?V to ?V’ in the graph of variable dependencies of \( A \) and \( F \) is the union of the labels of the shortest path, \( ((p, n)/i,(p', m)/j, F \cup \{f_1, \ldots, f_l\}) \in E \), where \( f_1, \ldots, f_l, 0 \leq l \), are the function symbols of the terms in \( t_i \) in which ?V appears.

Definition (Strong safeness). A set of rule implications \( R \) is strongly safe if its dependency graph does not contain cycles involving edges labelled with sets involving a function defined in [RIF-DTB] that is not a casting function. A RIF document \( R \) is strongly safe if the set of rule implications that are subformulas of \( R \) is strongly safe.
Editor's Note: We might want to have a restricted set of function symbols to check, because possibly not every external function generates new values.

7 Conformance Clauses

RIF-Core conformance is described in terms of semantics-preserving transformations.

Let Τ be a set of datatypes and symbol spaces that includes the datatypes specified in [RIF-DTB] and the symbol spaces rif:iri and rif:local. Suppose also that Ε is a set of external predicates and functions that includes the built-ins listed in [RIF-DTB]. We say that a formula φ is a CoreΤ,Ε formula iff

- φ is a well-formed Core formula,
- all the datatypes and symbol spaces used in φ are in Τ, and
- all the externally defined functions and predicates used in φ are in Ε.

A RIF processor is a conformant CoreΤ,Ε consumer iff it implements a semantics-preserving mapping from the set of all safe CoreΤ,Ε formulas to the language L of the processor.

A RIF processor is a conformant CoreΤ,Ε producer iff it implements a semantics-preserving mapping from the language L of the processor to a set of safe CoreΤ,Ε formulas.

An admissible document is an XML document that conforms to all the syntactic constraints of RIF-Core, including ones that cannot be checked by an XML Schema validator. Note that the concrete presentation syntax given in Section 2.6 is purely informative (to help implementers see the set of language structures supported by RIF-Core); the only normative concrete syntax for RIF-Core is the XML syntax.

In addition:

- Conformant BLD producers and consumers are required to support only the entailments of the form φ |=COREψ, where ψ is a closed RIF-Core condition formulas, that is a RIF-Core condition formula which also meets the criteria for closed condition formula defined in RIF-BLD.
- A conformant Core consumer is a conformant CoreΤ,Ε consumer in which Τ consists only of the symbol spaces and datatypes, and Ε consists only of the externally defined functions and predicates that are required by RIF-Core. The required symbol spaces are rif:iri and rif:local, and the datatypes and externally defined terms (built-ins) are the ones specified in [RIF-DTB]. A conformant RIF-Core consumer must reject all inputs that do not match the syntax of safe Core formulas. If it implements
extensions, it may do so under user control -- having a "strict Core" mode and a "run-with-extensions" mode.

- **A conformant Core producer** is a conformant Core \( \text{T,E} \) producer which produces documents that include only the symbol spaces, datatypes, and externals that are required by Core.

---

**Feature At Risk #3: Strictness Requirement**

*Note: This feature is "at risk" and may be altered or removed from this specification based on feedback. If you have concerns about this or information which may be useful in our eventual decision, please tell us at public-rif-comments@w3.org. See the full list of features "at risk" in RIF.*

The two preceding clauses are features **AT RISK**. In particular, the "strictness" requirement is under discussion.

---

**8 Acknowledgements**

This document is the product of the Rules Interchange Format (RIF) Working Group (see below) whose members deserve recognition for their time and commitment. The editors extend special thanks to Jos de Bruijn for his safeness definition and to: Jos de Bruijn, Leora Morgenstern, Christian de Sainte-Marie, Stella Mitchell and Changhai Ke for their thorough reviews and insightful discussions; the working group chairs, Chris Welty and Christian de Sainte-Marie, for their invaluable technical help and inspirational leadership; and W3C staff contact Sandro Hawke, a constant source of ideas, help, and feedback.

The regular attendees at meetings of the Rule Interchange Format (RIF) Working Group at the time of the publication were: Adrian Paschke (Freie Universitaet Berlin), Axel Polleres (DERI), Changhai Ke (ILOG), Chris Welty (IBM), Christian de Sainte Marie (ILOG), Dave Reynolds (HP), Gary Hallmark (ORACLE), Harold Boley (NRC), Hassan Aït-Kaci (ILOG), Jos de Bruijn (FUB), Leora Morgenstern (IBM), Michael Kifer (Stony Brook), Mike Dean (BBN), Sandro Hawke (W3C/MIT), and Stella Mitchell (IBM).

10 Appendix: XML Schema for RIF-Core

The namespace of RIF is http://www.w3.org/2007/rif#.

XML schemas for the RIF-Core sublanguages are defined below and are also available here with additional examples.

10.1 Condition Language

```xml
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns="http://www.w3.org/2007/rif#"
  targetNamespace="http://www.w3.org/2007/rif#"
  elementFormDefault="qualified"
  version="Id: CoreCond.xsd, v. 1.2, 2009-06-25, hboley/apaschke">
    schemaLocation='http://www.w3.org/2001/xml.xsd'/>
  <xs:annotation>
    <xs:documentation>
      This is the XML schema for the Condition Language as defined by the RIF-Core dialect.
    </xs:documentation>
  </xs:annotation>
  The schema is based on the following EBNF for the RIF-Core Condition Language (prepared for generalization to the RIF-BLD and RIF-PRD Condition Languages):

  FORMULA ::= IRIMETA? 'And' '( FORMULA* )' |
  IRIMETA? 'Or' '( FORMULA* )' |
  IRIMETA? 'Exists' Var+ '( FORMULA )' |
  ATOMIC |
  IRIMETA? Equal |
  IRIMETA? Member |
  IRIMETA? 'External' '( Atom )'
```
ATOMIC ::= IRIMETA? (Atom | Frame)
Atom ::= UNITERM
UNITERM ::= Const '()' (TERM* ')
GROUNDUNITERM ::= Const '()' (GROUNDTERM* ')
Equal ::= TERM '=' TERM
Member ::= TERM '#' TERM
Frame ::= TERM ']' (TERM '->' TERM)* ']
TERM ::= IRIMETA? (Const | Var | List | 'External' '( Expr ')
GROUNDTERM ::= IRIMETA? (Const | List | 'External' '(' Expr '(' GROUNDUNITERM ')' ')')
Expr ::= UNITERM
List ::= 'List' '(' GROUNDTERM* ')
Const ::= '!' UNICODESTRING '^^' SYMSPACE | CONSTSHORT
Name ::= UNICODESTRING
Var ::= '?' UNICODESTRING
SYMSPACE ::= ANGLEBRACKIRI | CURIE
IRIMETA ::= '(*' IRICONST? (Frame | 'And' '(' Frame* '))?' ')*'

</xs:documentation>
</xs:annotation>

<xs:group name="FORMULA">
 <!--敏感于FORMULA (Atom)语境-->
FORMULA ::= IRIMETA? 'And' '(' FORMULA* ')' |
               IRIMETA? 'Or' '(' FORMULA* ')' |
               IRIMETA? 'Exists' Var+ '(' FORMULA ') ' |
               ATOMIC |
               IRIMETA? Equal |
               IRIMETA? Member |
               IRIMETA? 'External' '(' Atom ')' 
</xs:choice>

11 Appendix: RIF Media Type Registration

The anticipated RIF media type is "application/rif+xml". The draft registration for this media type (pending IETF discussion and approval by the IESG) follows.

Type name: application

Subtype name: rif+xml

Required parameters: none

Optional parameters: charset, as per RFC 3023 (XML Media Types)

Encoding considerations: same as RFC 3023 (XML Media Types)

Security considerations:
Systems which consume RIF documents are potentially vulnerable to attack by malicious producers of RIF documents. The vulnerabilities and forms of attack are similar to those of other Web-based formats with programming or scripting capabilities, such as HTML with embedded Javascript.

Excessive Resource Use / Denial of Service Attacks

Complete processing of a RIF document, even a conformant RIF Core document, may require arbitrarily great CPU and memory resources. Through the use of "import", processing may also require arbitrary URI dereferencing, which may consume all available network resources on the consuming system or other systems. RIF consuming systems SHOULD implement reasonable defenses against these attacks.

Exploiting Implementation Flaws

RIF is a relatively complex format, and rule engines can be extremely sophisticated, so it is likely that some RIF consuming systems will have bugs which allow specially constructed RIF documents to perform inappropriate operations. We urge RIF implementors to make systems which carefully anticipate and handle all possible inputs, including those which present syntactic or semantic errors.

External (Application) Functions

Because RIF may be extended with local, application defined datatypes and functions, new vulnerabilities may be introduced. Before being installed on systems which consume untrusted RIF documents, these external functions should be closely reviewed for their own vulnerabilities and for the vulnerabilities that may occur when they are used in unexpected combinations, like "cross-site scripting" attacks.

In addition, as this media type uses the "+xml" convention, it shares the same security considerations as other XML formats; see RFC 3023 (XML Media Types).

Interoperability considerations:

This media type is intended to be shared with other RIF dialects, to be specified in the future. Interoperation between the dialects is governed by the RIF specifications.
Published specifications:

RIF Core Dialect  
W3C Working Draft (Recommendation Track)  
http://www.w3.org/TR/rif-core/

RIF Datatypes and Builtin
W3C Working Draft (Recommendation Track)  
http://www.w3.org/TR/rif-dtb/

RIF Basic Logic Dialect
W3C Working Draft (Recommendation Track)  
http://www.w3.org/TR/rif-bld/

RIF Production Rule Dialect
W3C Working Draft (Recommendation Track)  
http://www.w3.org/TR/rif-prd/

RIF Framework for Logic Dialects
W3C Working Draft (Recommendation Track)  
http://www.w3.org/TR/rif-fld/

This media type is intended for use by all RIF dialects,  
including those to be specified in the future. Identification 
of the RIF dialect in use by a document is done by examining 
the use of specific XML elements within the document.

Applications that use this media type:

Unknown at the time of these drafts. Multiple applications are  
expected, however, before the specification reaches W3C  
Proposed Recommendation status.

Additional information:

Magic number(s):

As with XML in general (See RFC 3023 (XML Media Types)), 
there is no magic number for this format.

However, the XML namespace "http://www.w3.org/2007/rif#" will 
normally be present in the document. It may theoretically 
be missing if the document uses XML entities in an  
obfuscatory manner.

The hex form of that namespace will depend on the charset.  
For utf-8, the hex is: 68 74 74 70 3a 2f 2f 77 77 77 2e 77  
33 2e 6f 72.
File extension(s):
.if (or .xml)

Macintosh file type code(s):
"TEXT" (like other XML)

Person & email address to contact for further information:

Sandro Hawke, sandro@w3.org. Please send technical comments and questions about RIF to public-rif-comments@w3.org, a mailing list with a public archive at http://lists.w3.org/Archives/Public/public-rif-comments/

Intended usage:

COMMON

Restrictions on usage:

None

Author:

The editor and contact for this media type registration is Sandro Hawke, sandro@w3.org.

Change controller:

RIF is a product of the Rule Interchange Format (RIF) Working Group of the World Wide Web Consortium (W3C). See http://www.w3.org/2005/rules/wg for information on the group. The W3C (currently acting through this working group) has change control over the RIF specification.

12 Appendix: Change Log (Informative)

This appendix summarizes the main changes to this document since the draft of July 3, 2009.

- IRI was replaced with ANGLEBRACKIRI in CoreRule.xsd, v. 1.3.
• The complexType ANYURICONST was introduced in CoreRule.xsd, v. 1.3.
• A number of typos were found and fixed.
