MediaStreams and media elements

Assignment

- As .src via createObjectURL

  - Should we exchange scheme "blob" for "mediastream" as prop by Robert?

- Direct assignment .srcObject

- Should we support both?

  - Need to spec up interaction and a few other things

Areas of concern

- Exact match between media element's audio/videoTracks and MediaStream's audio/videoTracklist

    - Is order/index preserved?

    - What happens at add/remove track?

Areas of concern continued

- Enabled/selected vs. enabled/disabled

    - The media element allows app to select which audio track(s) are played (mixed) and which video track is played

    - Likewise, the app can individually enable/disable MediaStreamTracks

    - Opens for ambiguities; what if a specific video track is selected on the media element, but said video MediaStreamTrack is disabled?

    - Clearer if enable/disable is in one place only
